RS The Remote Support Program

THE PILOT GUIDE · 15 OCTOBER 2026

Set up your company, and see everything it can do

Part 1 takes you from your pilot link to your first remote session, step by step. Part 2 is what is new since our last guide. Part 3 is the full tour. Real screenshots throughout, with **your** name and logo where ours would be.

WELCOME, PILOT PARTNER

Your pilot account, in one page

Thank you for helping us shape the product. Here is what you get, and the order to set things up in. Each step has its own page, with screenshots.

Your deal

- **Five seats free while you are a pilot company.** No trial, no card, and a price change for other customers does not touch it.
- **Five seats; more on request** — the service is made for small IT companies. If we agree to more, each seat past five is invoiced at R300 a month. We may end a pilot with 30 days' notice by email.
- **One owner login that only oversees the company is free on top.** It sees everything, imports clients and comments on tickets, but does not work on tickets or connect to computers.
- Your Billing page shows your price and keeps a copy of the terms you accepted.

What a seat is

Anybody who works: a technician, a supervisor or an office administrator. One person with several of those roles still uses one seat.

What you need

- Your pilot link (we email it to you). It works **once**, for **30 days**.
- A phone with **Microsoft Authenticator** or **Google Authenticator**, for two-factor sign-in.
- Your logo as a PNG, ideally on a transparent background.
- Windows 10 or 11 for the technician console.
- Optional: your client list from your old system, as Excel or CSV.

Setting up, in nine steps

1 Open your pilot link
Accept the terms and fill in your company. Five minutes.

2 Sign in, two-factor
Scan a code with your phone. Keep the recovery codes safe.

3 Brand it
Your logo, colours and wording, and when customers are asked to allow you in.

4 Add your people
They get an email and choose their own passwords.

5 Install the console
On each technician's PC, from your own download link.

6 Add your clients
One at a time, or import your whole list.

7 Give customers the app
Send your link. They choose Get help now or Install.

8 Connect for the first time
Double-click a computer. A ticket is written for you.

9 Switch on the extras when you are ready
Tickets by email, website chat, browser support, the monthly health check, outside help, suppliers for quotes, recurring tasks.

PART 1

Setting up your company

From your pilot link to your first remote session. Do the steps in order the first time; after that, come back to any of them whenever you like.

1 · Open your pilot link page 4

2 · Sign in and set up two-factor page 5

3 · Brand it page 6

4 · Add your people page 7

5 · Install the technician console page 8

6 · Add your clients page 9

7 · Give your customers the app page 10

8 · Connect for the first time page 11

9 · The extras page 12

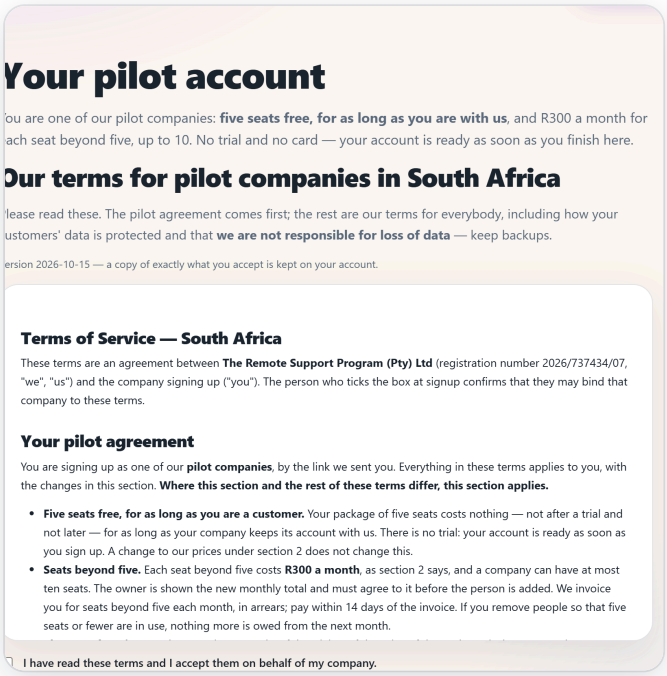

Part 2 · What is new since 9 October page 13

Part 3 · The full tour page 18

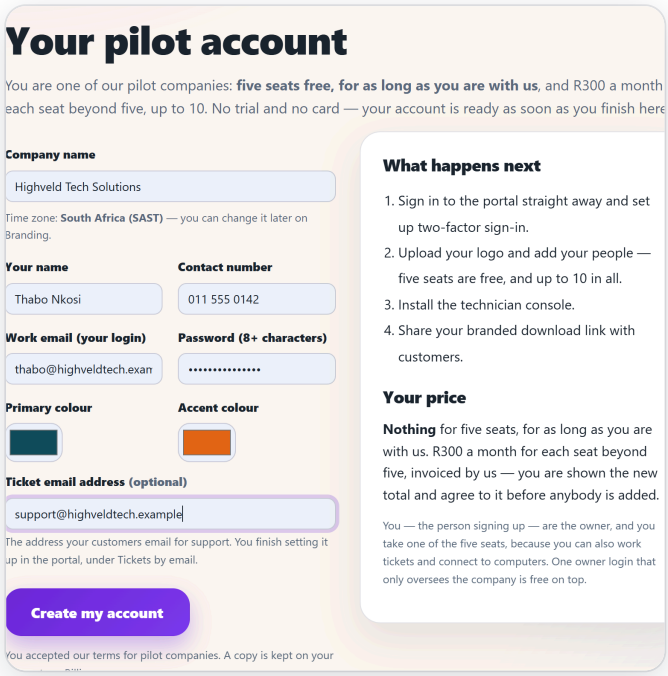

STEP 1 OF 9

1 Open your pilot link

We email you a link that starts with **theremotesupportprogram.com/pilot/**. It is yours alone: it works once, for 30 days. Open it on a computer rather than a phone; there is some reading.

First the terms. The pilot agreement comes first; scroll through, tick the box at the bottom, press Continue.

Then your company. Your company name and email are filled in from the link.

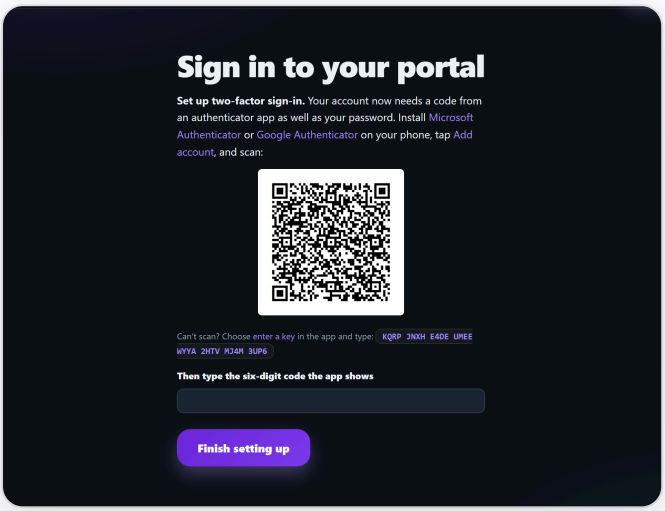

1. **Read the terms** and tick *I have read these terms and I accept them on behalf of my company.* Press **Continue**.
2. **Check the company name.** It appears on everything your customers see, so spell it the way you want it shown. (You can change it later on Branding.)
3. **Your name, contact number, work email and a password** of 8 characters or more. The email is your login. You are the **owner**, and because you can also work tickets and connect to computers, you use one of your five seats.
4. **Primary and accent colours**: click each square and pick your company's colours. The primary colour is for banners, the accent for buttons. Easy to change later.
5. **Ticket email address** (optional): the address your customers email for support, such as support@yourcompany.co.za. You finish setting it up later (step 9).
6. Press **Create my account**. Your account is ready at once.

> **Time zone:** South Africa is filled in for you. Every time in the portal is shown in your company's time, never the server's.

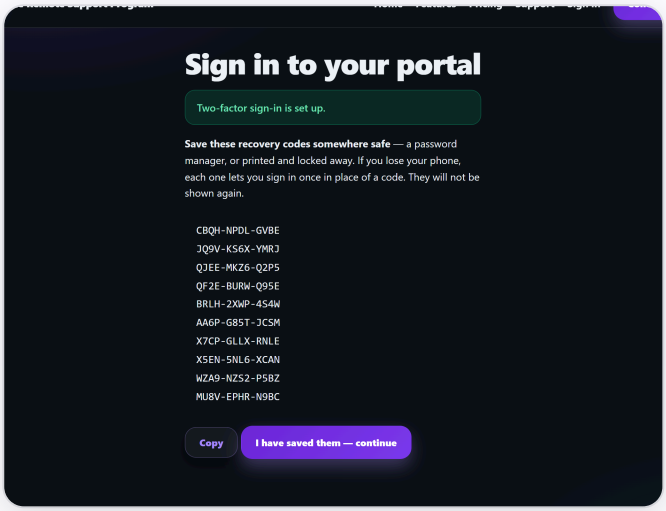

STEP 2 OF 9

2 Sign in and set up two-factor

Everyone signs in with a password **and** a six-digit code from an app on their phone. It is what stands between a stolen password and your customers' computers, so nobody can switch it off.

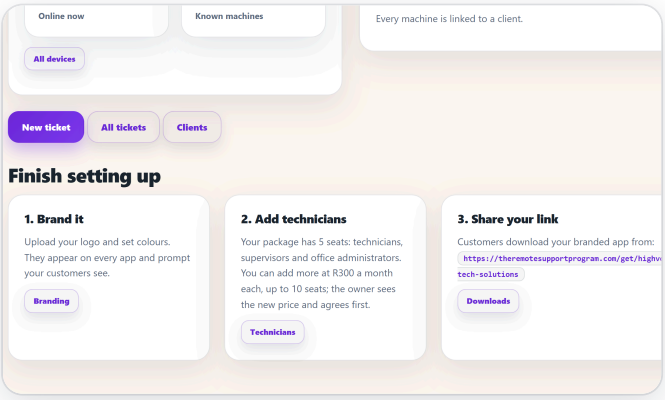

The first sign-in: scan the code with your authenticator app.

Then ten recovery codes. Print them or save them somewhere safe.

1. Go to **theremotesupportprogram.com** and press **Sign in**. Use the email and password from step 1.
2. On your phone, install **Microsoft Authenticator** or **Google Authenticator** (free). Tap **Add account** and scan the square code on the screen.
3. Type the six-digit code the app shows and press **Finish setting up**.
4. **Keep the ten recovery codes.** Each one works once, if your phone is ever lost.

Your dashboard

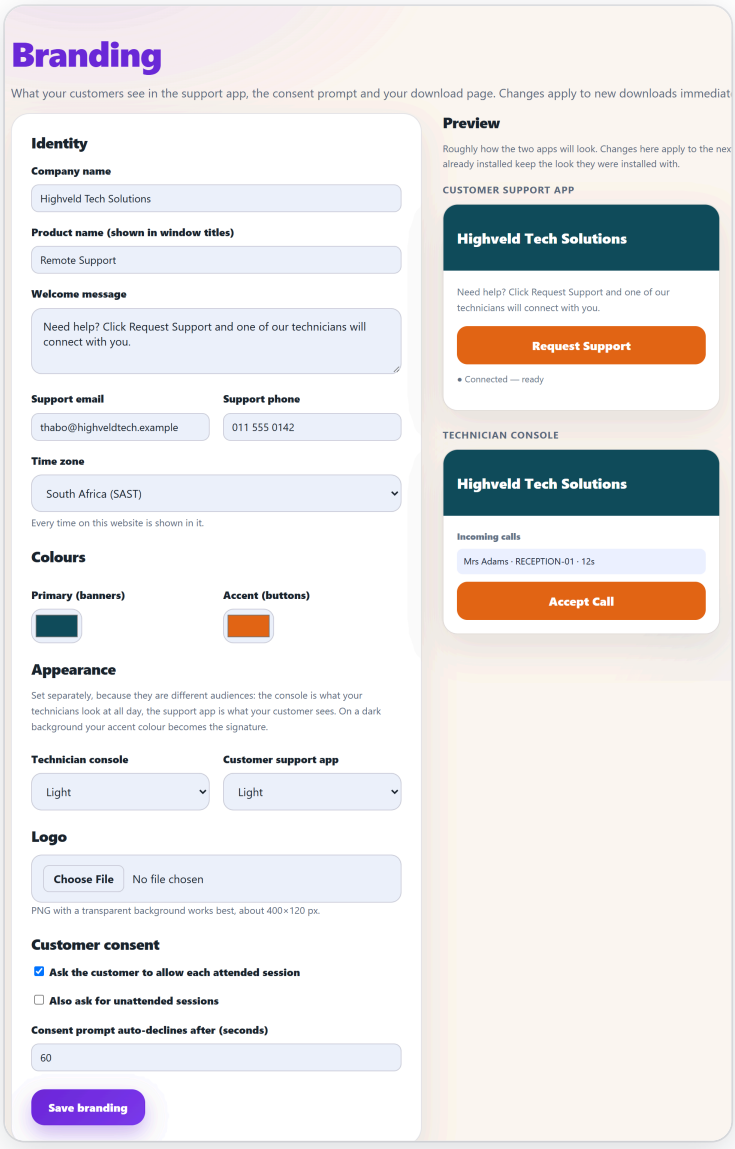

- You land on your **dashboard**. While it is new, **Finish setting up** at the bottom takes you to branding, your people and your download link.
- The **tabs along the top** are every page of the portal. Each step in this guide names the tab to press.
- A browser you have used before asks for the code **once a week**. Signing in on another computer signs the first one out.
- **Light or dark**: the button at the top right. It is yours alone.

STEP 3 OF 9

3 Brand it

Press the **Branding** tab. What you set here is what your customers see in the app, on your download page, in the website chat and in their monthly health report. The preview on the right changes as you type.

Branding, with a live preview of the customer's app and your console.

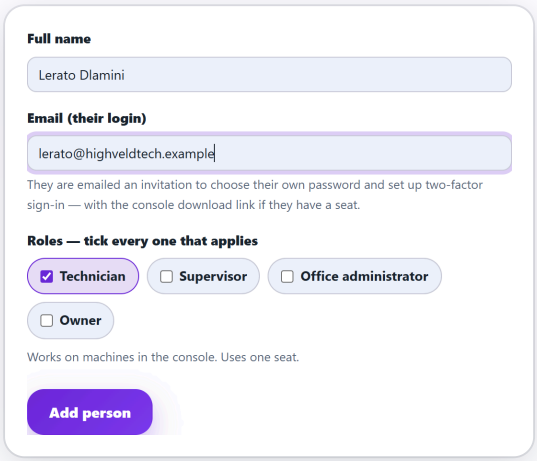

1. **Company name** and **Product name**: the product name is the title of your customer's app, for example *Highveld Remote Support*.
2. **Welcome message**: the line your customers read in the app.
3. **Support email and phone**, shown to customers who need you.
4. **Colours**, and **light or dark** for the console and for the customer's app.
5. **Logo**: Choose File. A PNG with a transparent background works best, about 400 × 120.
6. **Customer consent**:
   - *Ask the customer to allow each attended session* — leave this ticked. The person at the computer presses Allow before you see anything.
   - *Also ask for unattended sessions* — usually unticked: unattended means nobody is there to ask.
   - How long the question waits before it says no by itself.
7. Press **Save branding**.

> **Change it any time.** New downloads get it straight away, and computers that already have your app take the new look the next time they are idle. Only the look travels, never where they connect.

STEP 4 OF 9

4 Add your people

Press the **People** tab. You never type anyone's password: each person is emailed an invitation and chooses their own.

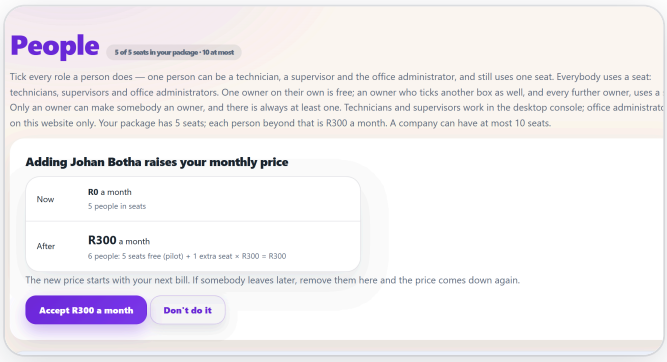

Add a person: a name, their email, and a tick for each role.

1. Under **Add a person**, type their **full name** and **email** (their login).
2. **Tick every role that applies** (below), then press **Add person**.
3. They get an email from your company. The link works for **72 hours**: they choose a password, set up two-factor on their phone, and, if they work on computers, are given the console download link.
4. Invitation lost? **Resend invitation** on their row. Later, **Send reset link** helps someone who forgot their password, and **Sign out** signs them out everywhere at once.

Role	What they can do	Seat
Technician	Works on computers in the console, and on their tickets.	1
Supervisor	The console, and runs the company's work: every ticket, assigning, approving, closing.	1
Office administrator	Books jobs in, quotes and invoices, in the portal. No access to customers' computers.	1
Owner	Billing, prices and people. On its own it oversees and comments only, and is free (one).	0

Several roles for one person still use one seat. A technician never closes a job: a supervisor or the office does.

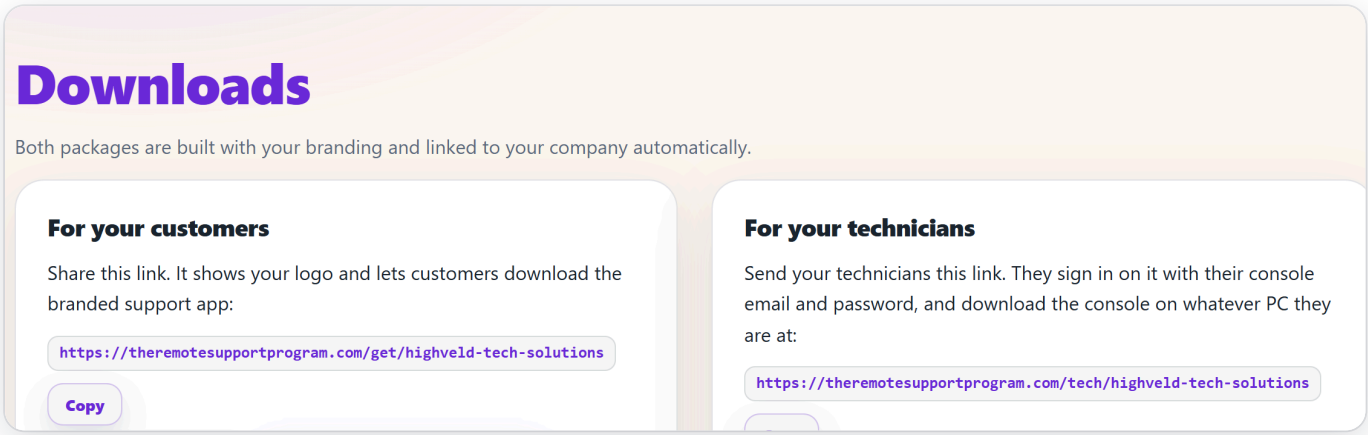

The sixth person: you are shown the new price and must accept it first.

> **Five seats; more on request.** When all your seats are in use, the Add form is replaced by the reason: remove someone who has left, or untick the boxes of somebody who no longer needs a seat — or an owner can ask us for more on the Billing page.

STEP 5 OF 9

5 Install the technician console

The console is the Windows program your technicians work in all day. Each technician installs it on their own PC from your company's link. It is one file, signed by The Remote Support Program (Pty) Ltd, so Windows shows who made it.

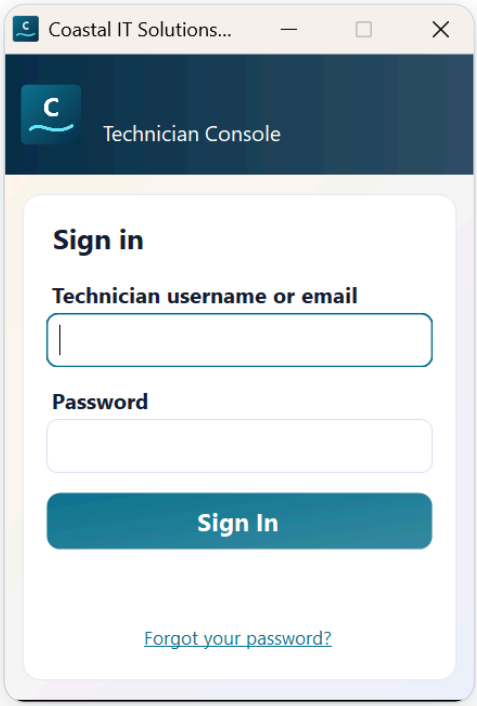

The Downloads tab: one link for your customers, one for your technicians.

1. Press the **Downloads** tab. Under **For your technicians**, press **Copy** and send the link to your team. (Their invitation email has it too.)
2. On the technician's PC, open the link and **sign in on the page** with their email, password and code.
3. Press **Download**, then open the file. It sets itself up with a **desktop shortcut**, already pointed at your company. Nothing else to configure.
4. Sign in to the console with the same **email, password and six-digit code**.

Your technicians' download page, in your name.

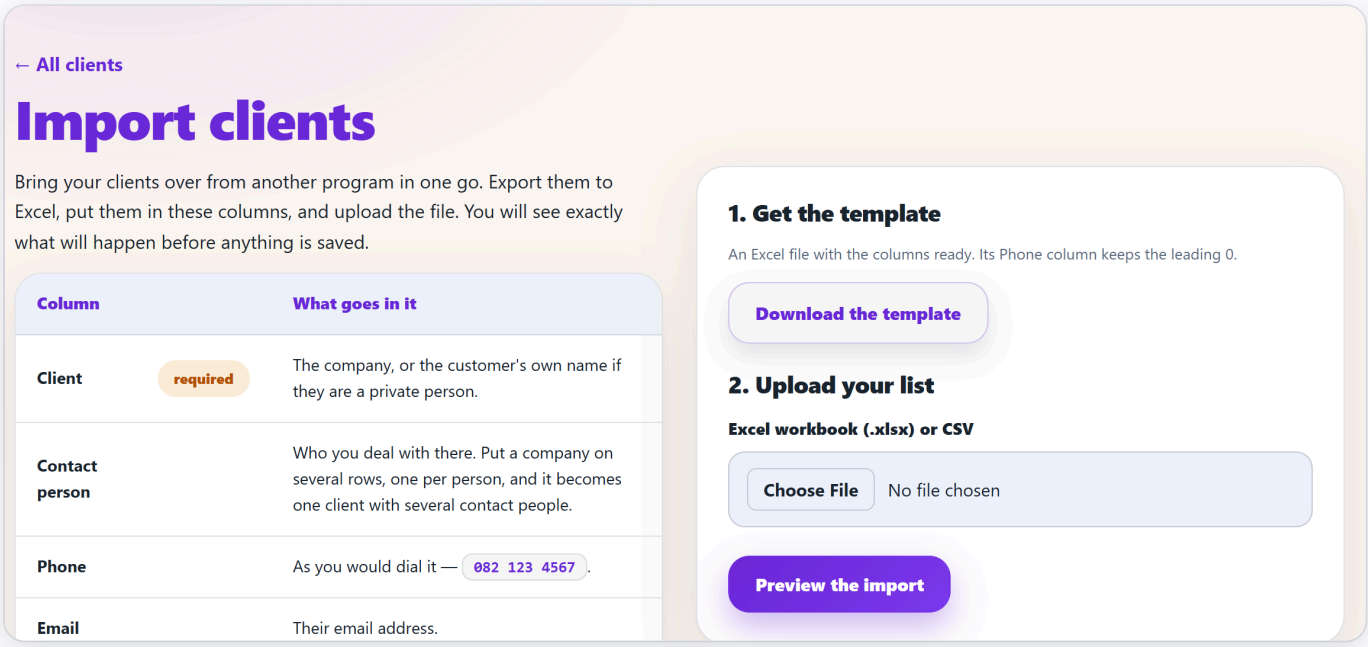

The console's sign-in, with your logo.

> **One sign-in at a time:** signing in to the console on another PC signs the first one out. The X button sends the console to the tray, so calls still reach you; **Sign out** is at the top right.

STEP 6 OF 9

6 Add your clients

Press the **Clients** tab. A client is a company or a private person you look after. Each one gets a page with its people, its computers, its tickets and its knowledge base.

Import clients: what goes in each column, the template, and your file.

A few clients

1. Open **Add a client** and fill in the name, a contact person, phone, email, address and any notes.
2. Press **Add client**. If the name already exists, the existing client is used instead of a duplicate.
3. Add more people to a client from its page.

Your whole list

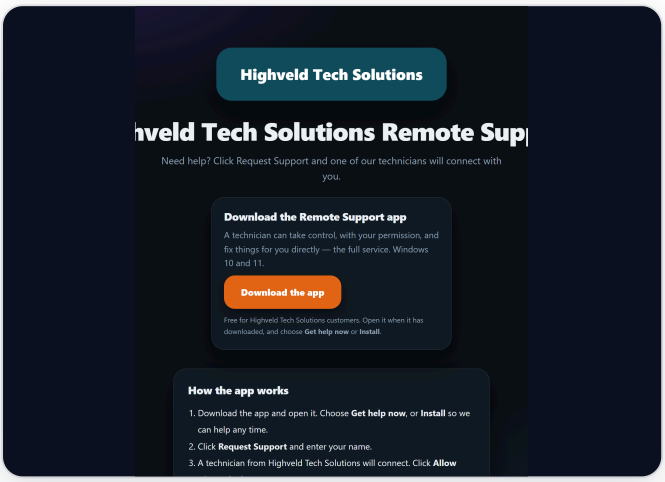

1. Press **Import clients**, then **Download the template**, or export from your old system to Excel or CSV.
2. Make sure there is a **Client** column. Contact person, Phone, Email, Address and Notes are used if they are there.
3. Choose the file and press **Preview the import**. Check the list, then press **Import**.

> **Safe to repeat.** Nothing you already have is overwritten: a client on file only has its blanks filled. Garbled letters and lost leading zeros on phone numbers are repaired, and every repair is listed for you.

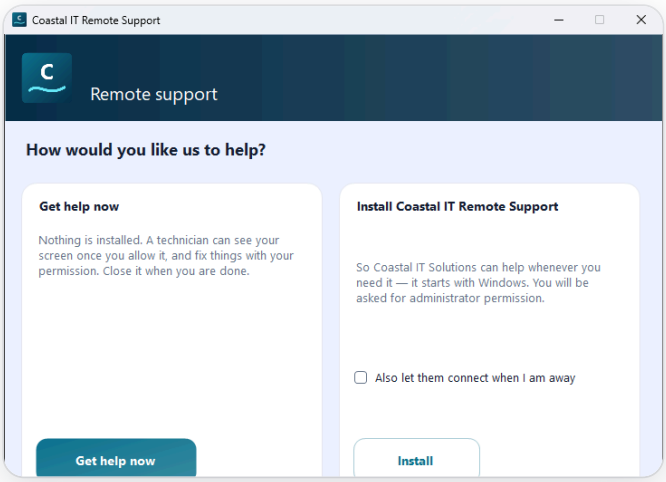

STEP 7 OF 9

7 Give your customers the app

Your customers download a small app with your name on it from your own link: Downloads tab, **For your customers**, **Copy**. Put it in your email signature, on your website, or send it when someone calls.

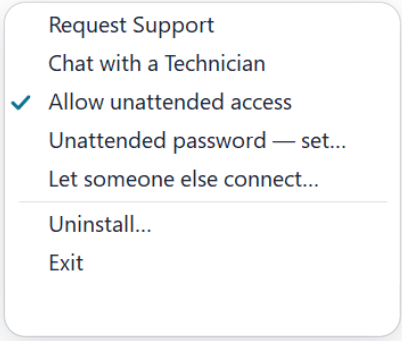

Your customers' download page.

Opening the app: Get help now, or Install.

1. The customer opens your link and presses **Download the app**, then opens the file.
2. **Get help now**: nothing is installed. Good for a one-off. They press Request Support, and you see it pop up.
3. **Install**: keeps it ready, starting with Windows, with your app by the clock. Windows asks for administrator permission once.
4. **Also let them connect when I am away** switches on **unattended access**, so you can reach the computer with nobody there. The customer can switch it off again from the app's menu, and can set an **unattended password** that you must type the first time.

The customer's menu by the clock.

> Installing on many computers at once? The download also installs silently. Ask us and we will show you.

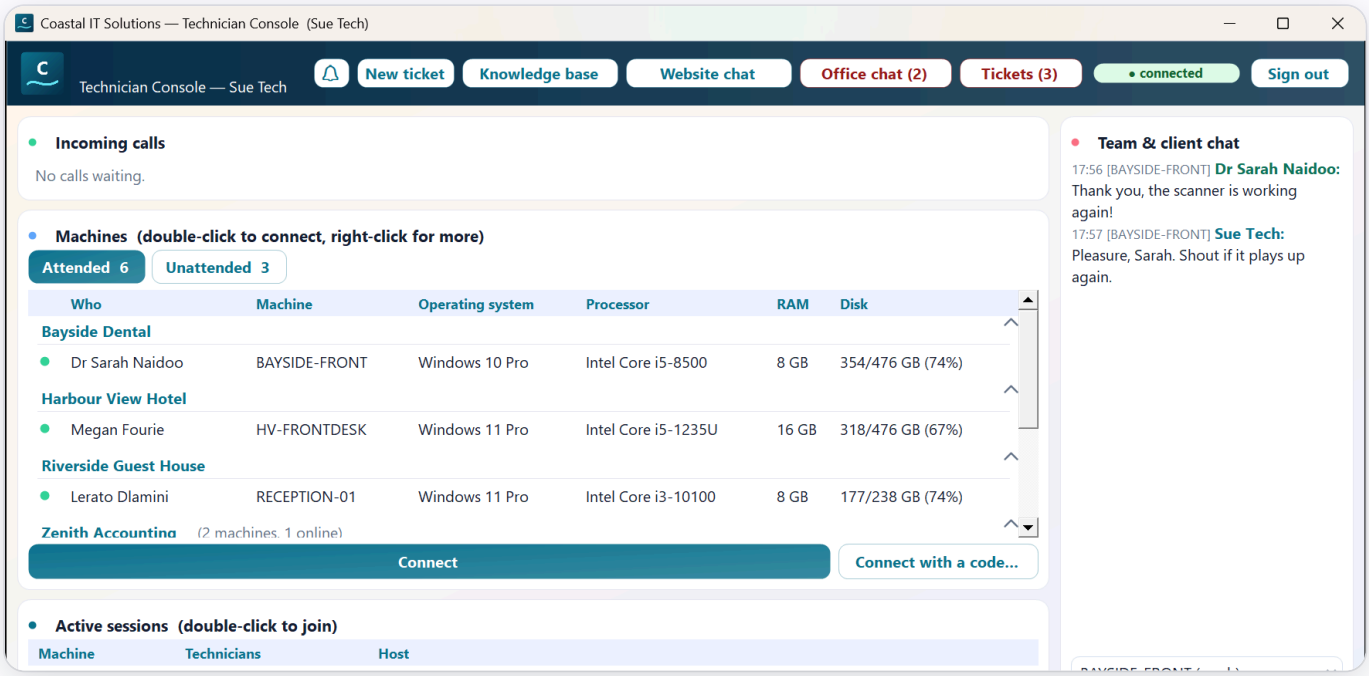

Then file the computer under its client

A new computer appears in your console under **Not linked to a client**. Right-click it and choose **Change the customer...**, or link it from the **Unassigned machines** box on the dashboard. From then on its tickets land on that client's page.

STEP 8 OF 9

8 Connect for the first time

With the console open and the app on a customer's computer, you are ready. Try it first on a computer in your own office.

The console: computers grouped by client, green when they are on. Requests for help pop up at the top.

You start it

1. **Double-click the computer** (or right-click, Connect).
2. Say in a few words **what it is about**. That becomes the ticket's subject.
3. On an attended computer the person there presses **Allow**. Unattended, you are straight in (with the password, if one is set).
4. Work as if you were there. **Tools** at the top has files, chat, scripts, printing and the rest.
5. Close the window when you are done.

They ask for help

1. The customer presses **Request Support** in their app and says what is wrong.
2. It rings softly in every technician's console, with their words and, if they ticked it, a picture of their screen.
3. Press **Accept** and you are connected.

> **The ticket writes itself.** Every session gets its own ticket with who, which computer, how long, files sent and scripts run. Reconnecting within 30 minutes carries on the same ticket without asking again.

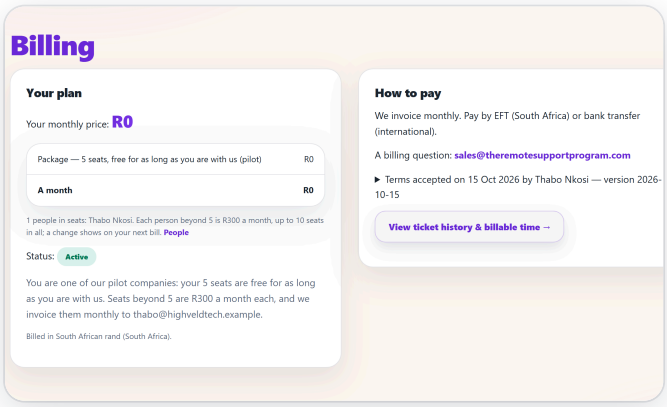

STEP 9 OF 9

9 The extras, when you are ready

None of these is needed to start. Switch each on when it suits you; Part 3 shows each one in full.

What	Where	What to do
Tickets by email	Tickets by email tab	Enter your support mailbox's details (it is only ever **read**, never changed), or forward it to the address shown. An email opens a ticket and gets an automatic reply with its number. Also lets you email a client from a ticket.
Website chat	Website chat tab	Switch it on, set your hours, and paste the one line shown into your website. Visitors' questions ring in everyone's console.
Support in a browser	Browser support tab	Switch it on and set your hours. New customers can share their screen from a browser, with nothing installed.
Monthly health check	A client's page	Tick *Monthly health check* for clients who should have it (your SLA clients, say). Their computers install it by themselves. Override any one computer with a right-click.
Outside help	Outside help tab	Off until you switch it on. Lets a customer give someone outside your company (their accountant, say) a one-time code.
Quotes	Items and Suppliers tabs	Add your suppliers and their email addresses, and a signature. Then Request quote on any job emails them.
Recurring tasks	Tickets tab, Recurring tasks	Set up anything done on a schedule once. A ticket opens by itself each time it is due.
Knowledge base	Knowledge base tab	Write down how things are done, in general and per client. The console points technicians to a client's articles when they connect.

Your price and your terms

The Billing tab: R0 for five seats, and a copy of the terms you accepted.

When you need us

- **Email** queries@theremotesupportprogram.com, or call **078 131 5618**.
- Tell us everything: what works, what gets in the way, what you wish it did. That is what the pilot is for.
- After a week we ask for a short review. Only if you say yes is it published, with your company's name.

> **Forgot a password?** *Forgot your password?* on the sign-in page. **Lost a phone?** Use a recovery code, or ask the owner to press Reset two-factor on the People page.

PART 2

New since 9 October

Most of it came from what our first testers told us. Marked NEW wherever it appears in Part 3. Nothing you already use has been taken away.

Tickets

- **Damage reports** for a machine that is not worth repairing, emailed to the client.
- **Files and photos on any comment**, and they go with it if you email it to the client.
- **Go back a step**, at every stage, with a reason.
- **Edit a ticket**: subject, description, appointment and type of job.
- **Sort tickets by date**, newest or oldest first.
- Comment boxes **grow as you type**.
- **Unlink** a ticket from a bigger job, or a computer from a client.

Chat

- **Hand a website chat over** to anyone signed in. The visitor is told.

Remote control

- **A sharper picture** that never stays blurry.
- **Two computers at once**, side by side, one on each screen.
- **Copy on one, paste on the other**: files go straight between the two computers, never through your PC.
- **Every app is signed** in our company's name, so Windows shows who made it.

Your customers

- The app **remembers their name**.
- The screen picture says when it only shows the desktop, and **takes a new one** of the window they mean.

Your company

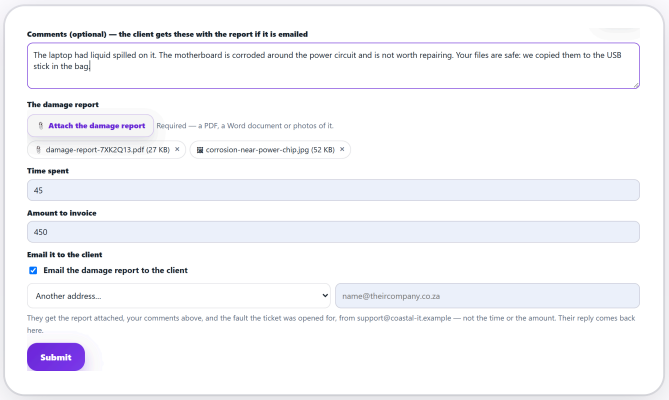

- **The owner-only login oversees**: it sees and comments, and leaves the work to the people with seats.
- **Reviews**: tell other IT companies what you think, published only with your yes.

NEW · TICKETS

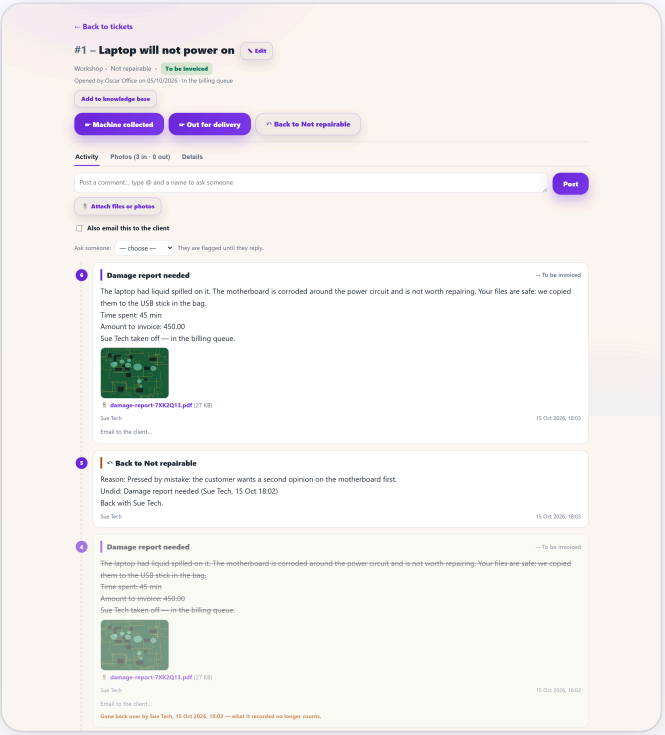

Damage reports, and going back a step

Not repairable: damage report needed

For insurance claims. After **Not repairable**, a workshop job now offers **Damage report needed** beside the inspection fee. Write a note for the client, attach the report (a PDF, a Word document or photos), and record your time and the amount. Tick **Email the damage report to the client** and they get the report, your note and the original fault, from your support address. **Never** the time or the amount. Then it goes to be invoiced.

The damage report step, with the report and a photo attached.

The story afterwards: the report on top, and a step that was undone, crossed through.

Go back a step, at every stage

- Pressed the wrong button? **Back to …** sits beside the next steps on every job, saying where it goes back to.
- Say **why**. The step that was undone stays in the story, crossed through, so nothing is lost.
- It warns you if an invoice, a payment or an email went out with that step. It cannot unsend an email.
- A closed job can be reopened by a supervisor or the owner.

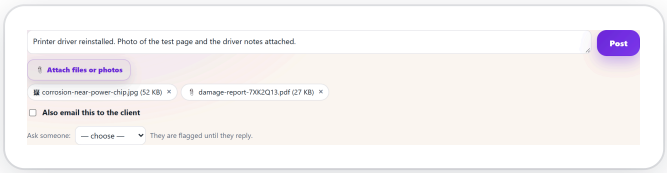

Going back, with the reason.

NEW · TICKETS

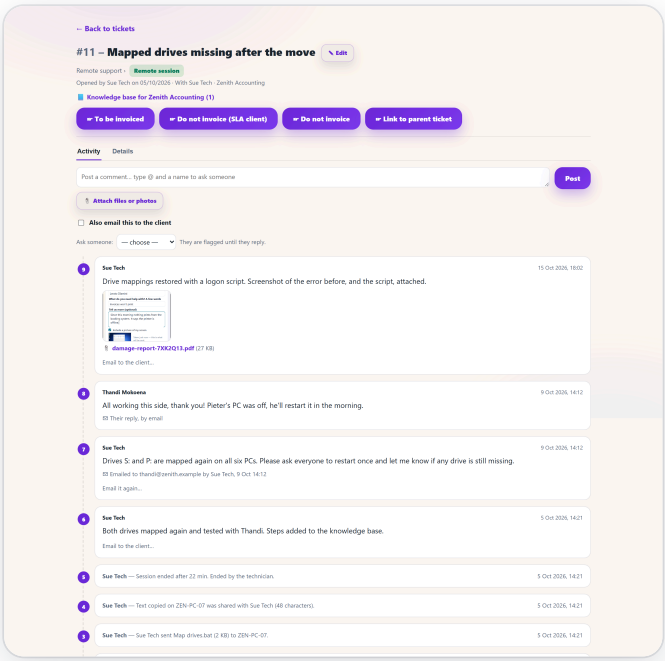

Files on comments, editing, sorting

Files and photos on any comment

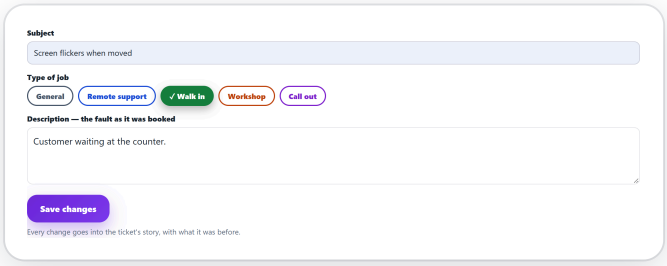

A comment with a photo and a PDF, ready to post.

- **Attach files or photos** under every comment box, in the portal and the console. Photos are made smaller first.
- A comment can be files alone.
- Tick **Also email this to the client** and the files go as attachments (up to 15 MB together).
- Comment boxes **grow as you type**, up to fifteen lines.

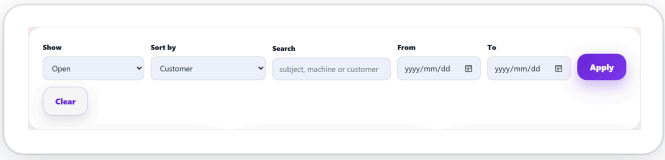

Posted: the picture shows on the ticket, the PDF opens with a click.

Edit a ticket

- ✎ **Edit** beside the title: the subject, the description, the appointment and the **type of job**.
- Anyone who can see the ticket can edit it. Every change goes into the story, with what it was before.
- A new type of job starts that type's steps from the beginning. Making it a workshop job asks for a technician and three photos, as booking in does.

Sort by date

- **Sort by** on the ticket list: newest or oldest first, last updated, appointment soonest first, or grouped by customer as before. The console has it too.
- The dashboard's **Unassigned** count now always matches the list it opens.
- **Unlink** a ticket from a bigger job, or a computer from its client: right-click in the console, or Unlink on the Devices page.

NEW · REMOTE CONTROL AND YOUR CUSTOMERS

Sharper, two at once, and a better picture of the problem

A picture that never stays blurry

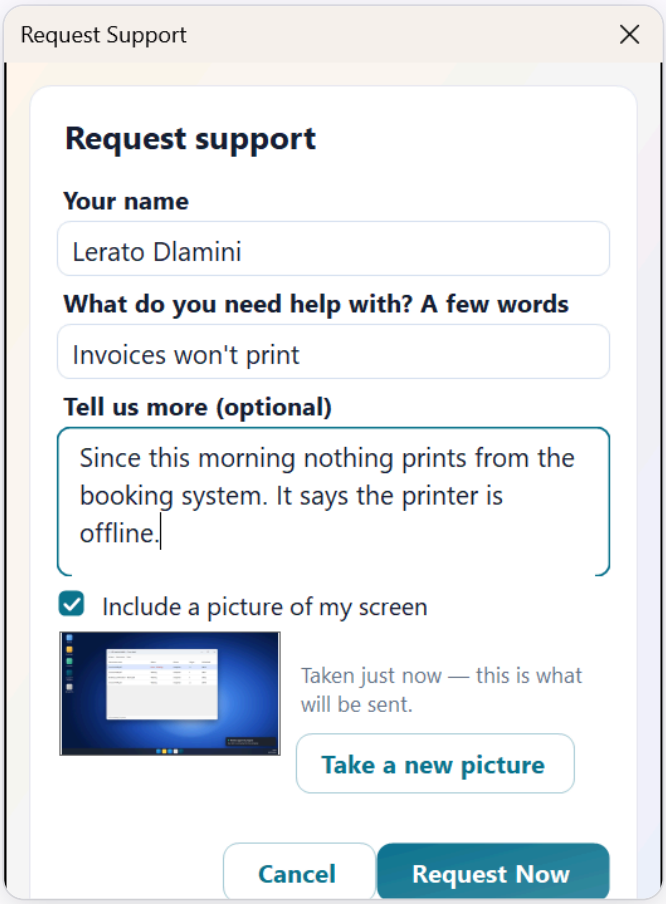

On some computers the screen arrived blocky and only slowly sharpened. Now a still screen is sharpened within two seconds of anything changing, and stays sharp.

Two computers at once

- Open **two sessions side by side**, one on each of your monitors. Two is the most, so nobody spreads themselves thin; reconnecting to one you have open never counts.
- **Copy on one, paste on the other.** Copy files on the first computer, click into the second and paste. The files go straight between the two computers through our server, sealed, **never through your PC**. Moving a client's data to their new computer no longer waits on your internet line.

Signed apps

Every program is now signed by **The Remote Support Program (Pty) Ltd**. Windows names us as the verified publisher instead of "Unknown publisher", and antivirus programs can see exactly who made it.

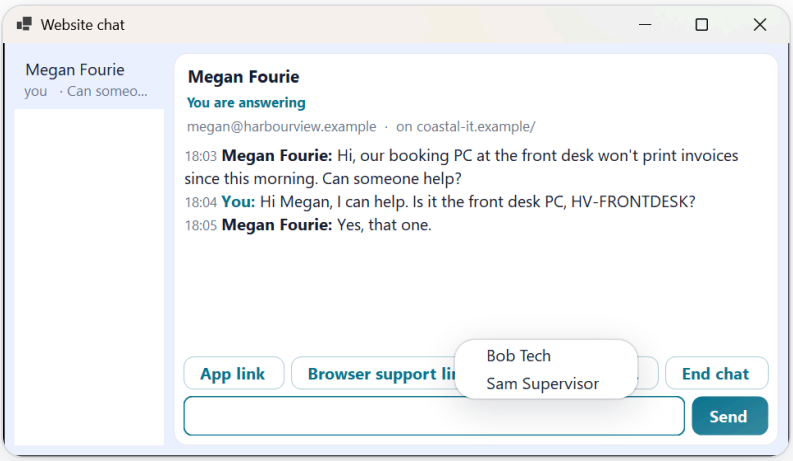

Asking for help: their name is remembered, and they can take a new picture of the window they mean.

- **The app remembers the customer's name**, so they type it once.
- Customers often minimise everything to find our icon on the desktop, so the picture showed only the desktop. Now it **says so**, and **Take a new picture** lets them bring up the window first.

NEW · CHAT AND YOUR COMPANY

Hand a chat over. Let the owner oversee.

Hand a website chat over

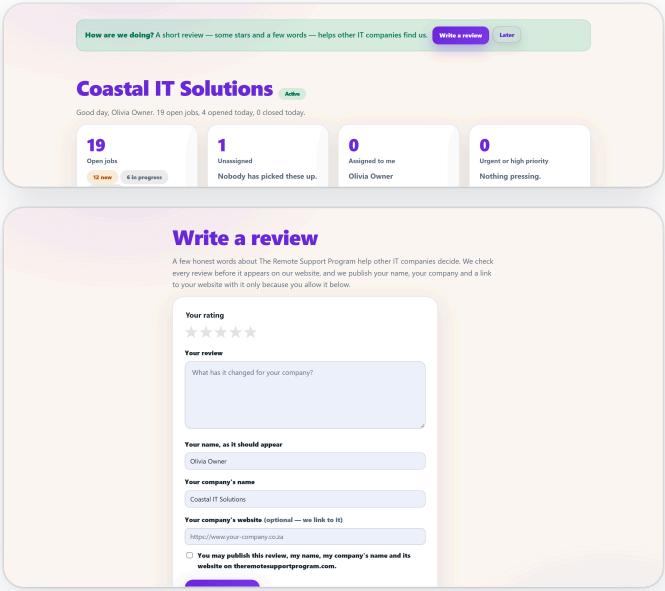

Hand over... lists everyone signed in now.

- Answering a visitor and need a colleague? **Hand over...**, in the console or the portal's chat corner, then pick a name.
- Only people signed in right now are offered. They are brought the chat with a ding.
- The visitor sees a note that someone else is taking over.
- The person answering can hand it over, and so can a supervisor.

The owner-only login oversees

- The free owner login runs the company: billing, people, branding, clients and imports, items, suppliers and the knowledge base.
- It **sees every ticket** and can **comment and @mention** anyone.
- It does **not** move jobs on, edit, assign, invoice or close them, answer website chats, or connect to computers. That is what the five seats are for.
- Want to work tickets as the owner? Tick **Supervisor** or **Office administrator** beside Owner. It then uses a seat.

Reviews

A week in, the portal asks once. Later asks again in a month.

Stars and a few words. We check every review, and publish it with your name and company only if you tick that we may.

PART 3

The full tour

Everything the product does today, page by page, from remote control to the Basic version for remote workers.

AT A GLANCE

What is in the box

One product, built from the ground up. Your technicians work in a Windows console, the office works in the web portal, and your customers get a small app with your name on it.

Remote control

A sharp, fast picture that adjusts to slow connections. Full control, including admin (UAC) prompts, Ctrl+Alt+Del and Windows shortcuts. Several screens, restart and reconnect.

Files, clipboard and tools

Copy and paste text and files both ways, drag and drop, printing both ways, scripts, sound, listen and talk, recording and a privacy screen.

A console that gets out of the way

Machines grouped by customer, attended and unattended tabs, incoming calls, office chat, website chat and tickets, all a click away.

Processes and performance

See any online machine's processes, processor, memory, disk and network live, without connecting and without interrupting the user.

Your customer's app

One download. Get help now or install. Ask for help with a picture of the screen, chat, and a switch the customer controls for unattended access.

Outside help

Your customer can let someone from outside your company in with a one-time code. You are told and can watch or end it.

Tickets with a route

Workshop, call out, walk in, remote support, general and recurring jobs, each with its own steps. Photos, quotes, delivery, invoicing and emailing the client.

Monthly health check

Automatic maintenance and a plain-English report on every chosen machine, with your logo, emailed to your customer each month.

Knowledge base

How things are done, in general and for each client, in folders. Write it from a ticket, keep every version, find it while you work.

Talk to people

Office chat, a chat bubble for your website, support straight from a web browser, and tickets that open from email or a contact form.

Security first

Sessions encrypted end to end, two-factor sign-in for everyone, one sign-in per person, roles, customer consent, unattended passwords and backups kept in two places.

The Basic version for remote workers

For people who just need to reach their own computers — the office PC from home, a branch: one person, three computers (more at R10 each), R50 a month — or one computer for nothing on the Free Version.

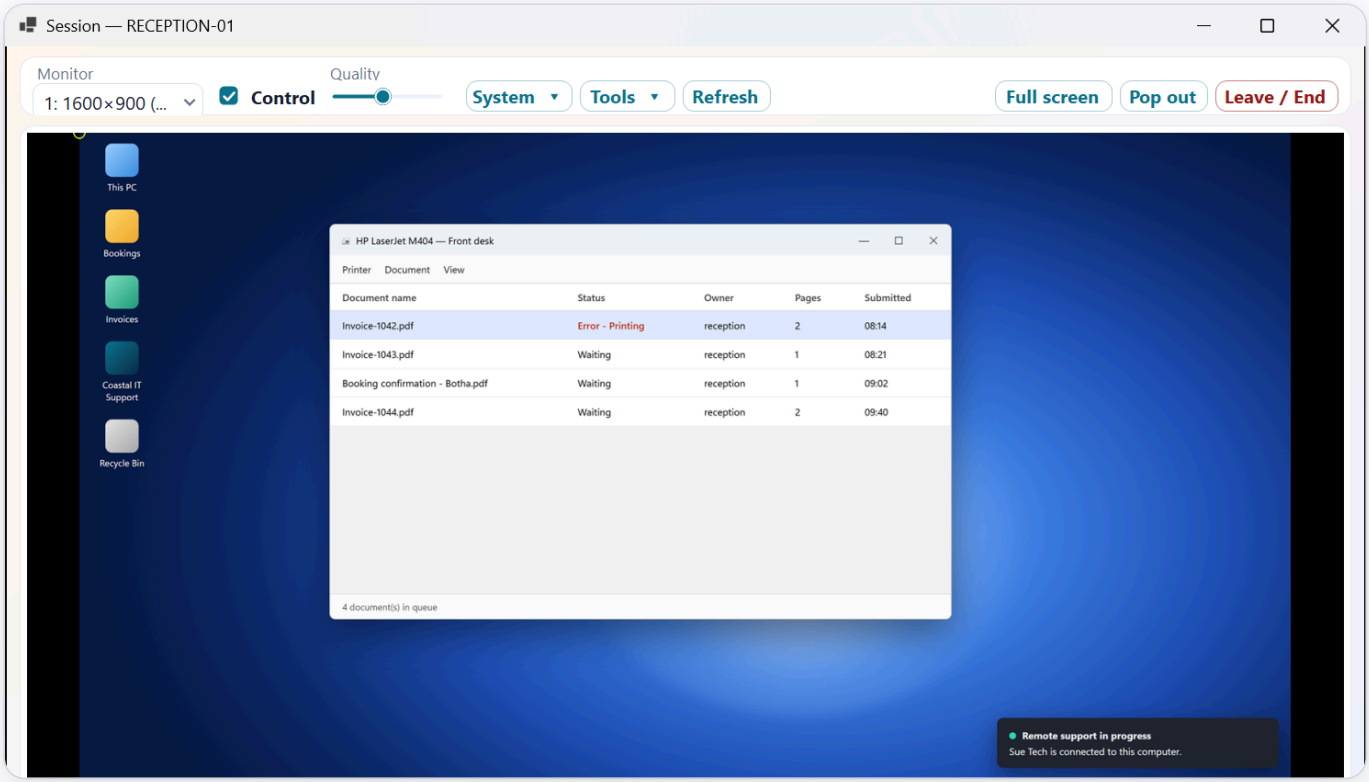

Your brand, not ours

Your customers see your company name, logo and colours in the app, the download page, the chat bubble and the monthly report. Change your branding and it reaches the computers that already have the app. Hosted in South Africa.

REMOTE CONTROL

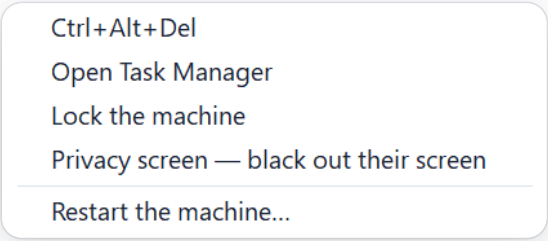

See it and fix it, as if you were there

Double-click a machine and you are on it. The picture is sharp and quick on a good line, and steps itself down on a poor one rather than freezing.

A session window. Bottom left, a green lock says the session is encrypted end to end. The customer's knowledge base is one click away.

- **Video-grade picture**, using the graphics card where there is one. A scrolling page needs about a fourteenth of the data older methods use, and the customer's computer barely notices.
- **Adapts to the connection**: on a slow line it lowers quality rather than stalling.
- **The customer's real mouse pointer**, in its real shape.
- **Every screen**: pick the monitor, go full screen, or pop the picture out.
- **Admin (UAC) prompts and the Ctrl+Alt+Del screen** can be seen and clicked.
- **Windows shortcuts go to their computer**: the Windows key, Alt+Tab, Ctrl+Shift+Esc and the rest, while the picture has your keyboard.
- **A still screen sharpens itself** NEW within two seconds, and stays sharp.
- **Two computers at once** NEW, one on each monitor. Copy files on one and paste on the other: they go straight between the two.

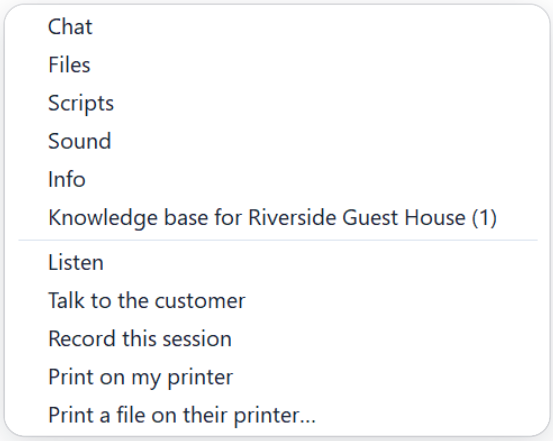

The System menu.

- **Restart the machine** and the session waits, then **reconnects by itself**.
- **A dropped connection recovers on its own.**
- **Several technicians** can join the same session.
- **Wake up** a computer that is switched off, from the right-click menu.

DURING A SESSION

Everything you need, without a cluttered screen

The tools live in one Tools menu. Each opens as its own small window you can move anywhere, so the customer's screen stays big.

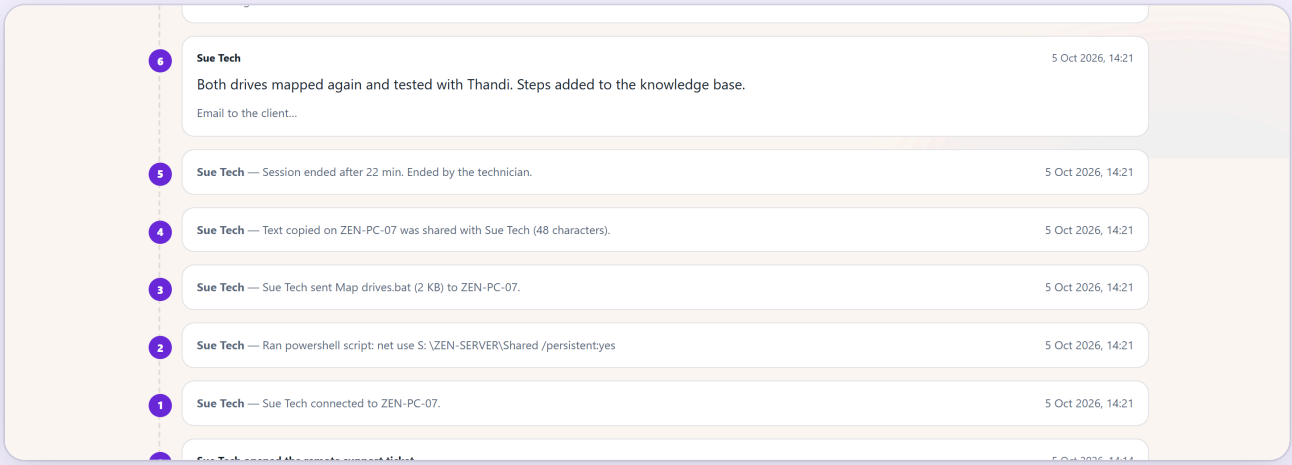

The Tools menu in a session.

- **Copy and paste, both ways**: text, files and whole folders.
- **Drag and drop** files onto their screen, or off it onto yours.
- **Files**: browse their computer, send and fetch files.
- **Scripts**: run PowerShell on their machine and watch the result.
- **Sound**: says in plain English why there is no sound, and plays a test tone.
- **Listen** to the computer, and **talk to the customer**. They are asked each time before their microphone is used.
- **Record this session**, saved as a video on the ticket.
- **Privacy screen**: their monitor goes black while you work.
- **Print on my printer**: their computer gets a printer with your name on it. Whatever they print comes out on yours.
- **Print a file on their printer**: send a document and it prints at their end.

Everything is written down for you

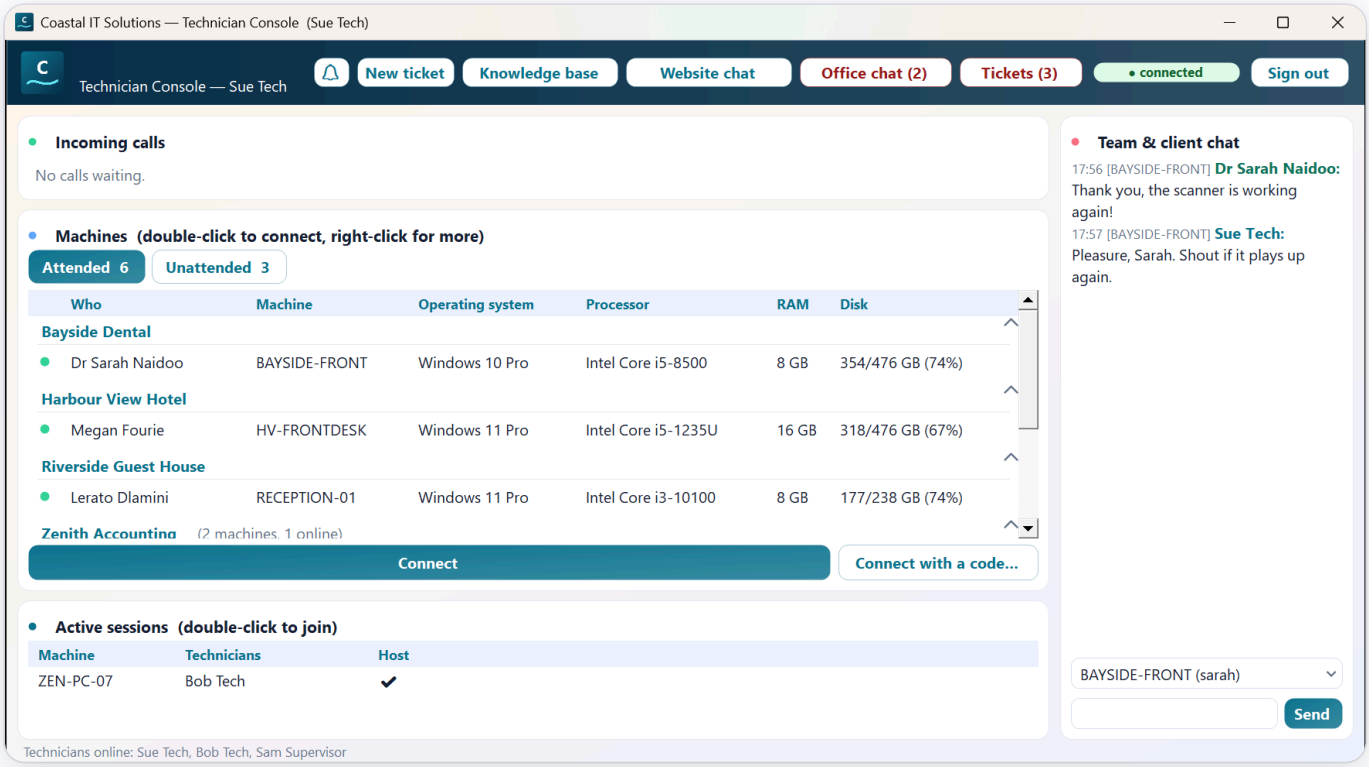

Every remote session gets its own ticket. Files sent, text copied (only its size, never the words, because clipboards often hold passwords), scripts run and how long it took all go onto it automatically.

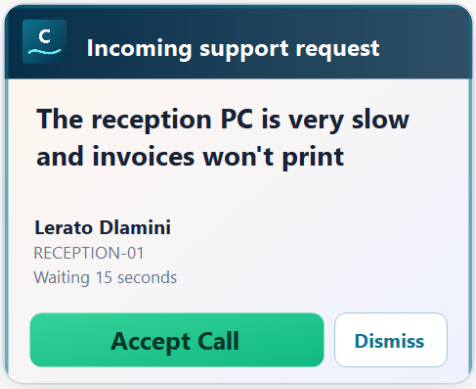

THE TECHNICIAN CONSOLE

Your whole day on one screen

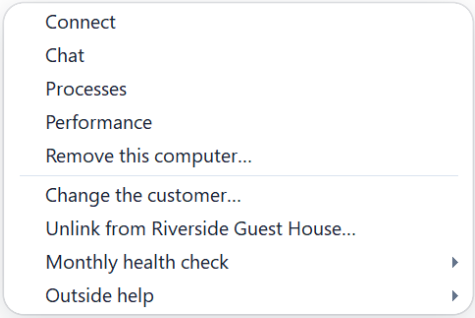

The console is home base. Machines are grouped under the customer who owns them, with what each one is running.

- **Attended and Unattended tabs.** Unattended shows the machines whose owners let you in when nobody is there.
- **Green or grey at a glance**, with the person, machine, Windows version, processor, memory and disk.
- **Support requests pop up** with what is wrong in the customer's own words. Accept, and you are connected.
- **Right-click a machine** to connect, chat, see processes or performance, link it to a customer or **unlink it** NEW, set its health check or outside help, or wake it up.
- **Active sessions**: double-click to join a colleague.
- Buttons for **tickets, the knowledge base, office chat and website chat**, each with a count of what is waiting.
- **Sounds**: a ding for a chat message and a soft ring while someone waits. The bell at the top mutes them.
- **Your logo on every window**, and light or dark for each person.

A customer asking for help.

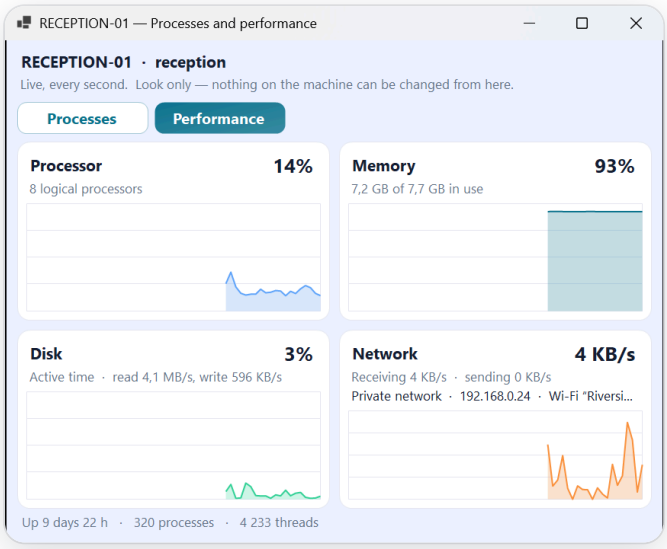

Right-click on a machine.

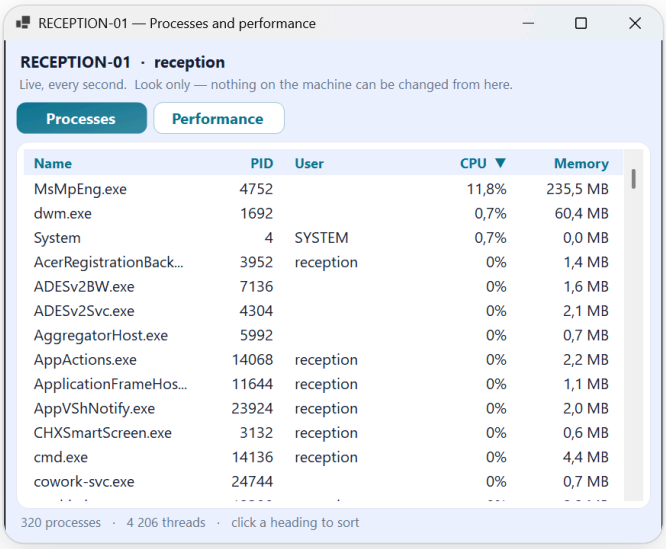

PROCESSES AND PERFORMANCE

Look under the bonnet without interrupting anyone

Right-click any online machine and choose Processes or Performance. You see it live, every second, without connecting and without the user noticing. It is look-only: nothing can be changed from here.

Performance: processor, memory, disk and network, with live graphs.

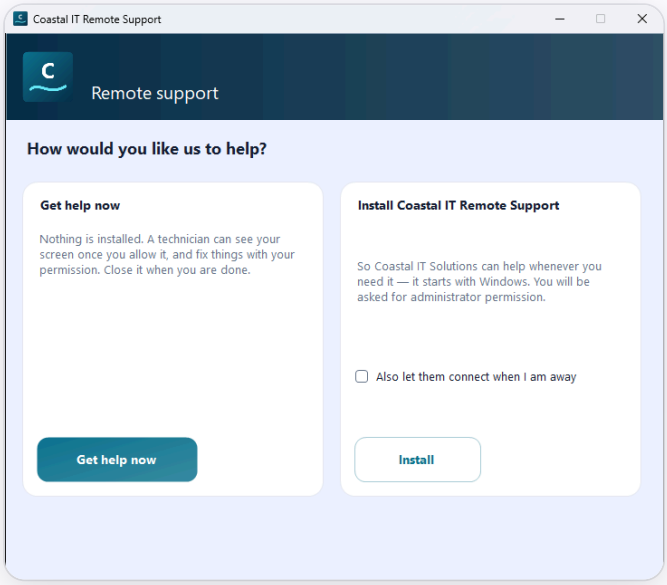

Processes, busiest first. Click a heading to sort.

- **"It's slow"**: see straight away whether it is the processor, memory, disk or network.
- **The network card** shows whether the connection is Private or Public (a Public network turns file sharing off), plus its IP address and Wi-Fi name.
- Shows how long the machine has been running, and how many programs it has open.
- A program that opens or closes shows up straight away.
- Several technicians can watch the same machine.

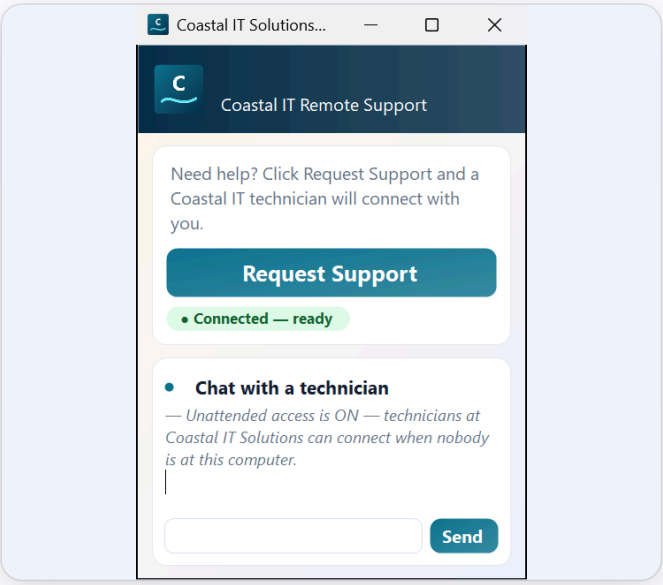

YOUR CUSTOMER'S SIDE

Simple for them, with your name on it

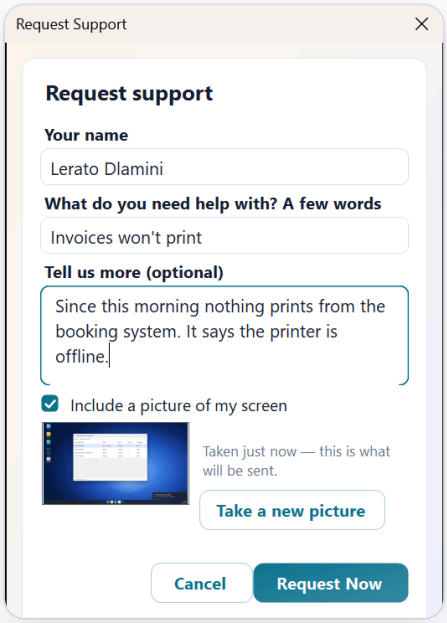

Your customers download one file from your link. It knows it belongs to you, and shows your name, logo and colours.

The first thing they see: get help now, or install.

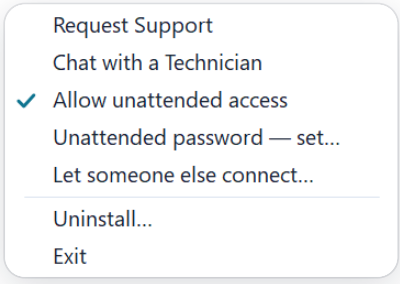

The installed app, with unattended access switched on.

Asking for help: a few words, more if they like, and a picture of their screen. Their name is remembered, and they can take a new picture NEW.

- **Get help now** needs nothing installed. **Install** keeps it ready, starting with Windows.
- **Asking for help**: a short subject, an optional description, and a tick to **send a picture of their screen**. They see the picture first. It lands on the ticket.
- **They are asked before an attended session starts.** A banner shows while someone is connected.
- **Unattended access is their switch**, with an optional password. Five wrong tries lock the machine for 15 minutes.
- **Exit means offline. Uninstall** is in the menu too.

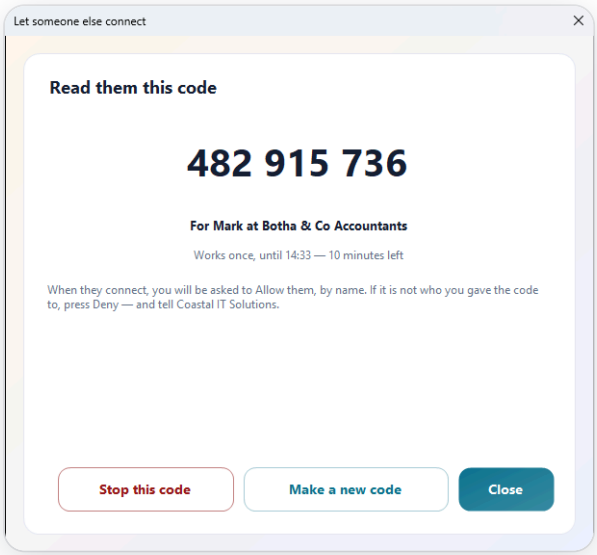

The menu by the clock.

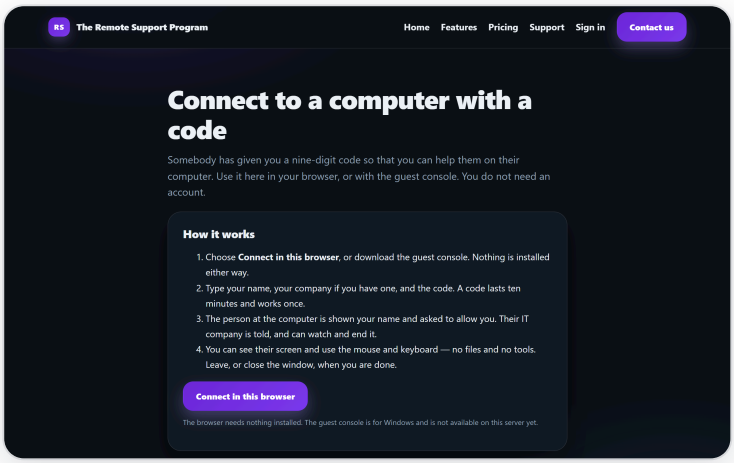

OUTSIDE HELP

When someone else needs to help your customer

Sometimes your customer needs their accountant, or a software supplier, on their computer. Instead of a separate remote tool, they let that person in with a one-time code. You stay in the picture.

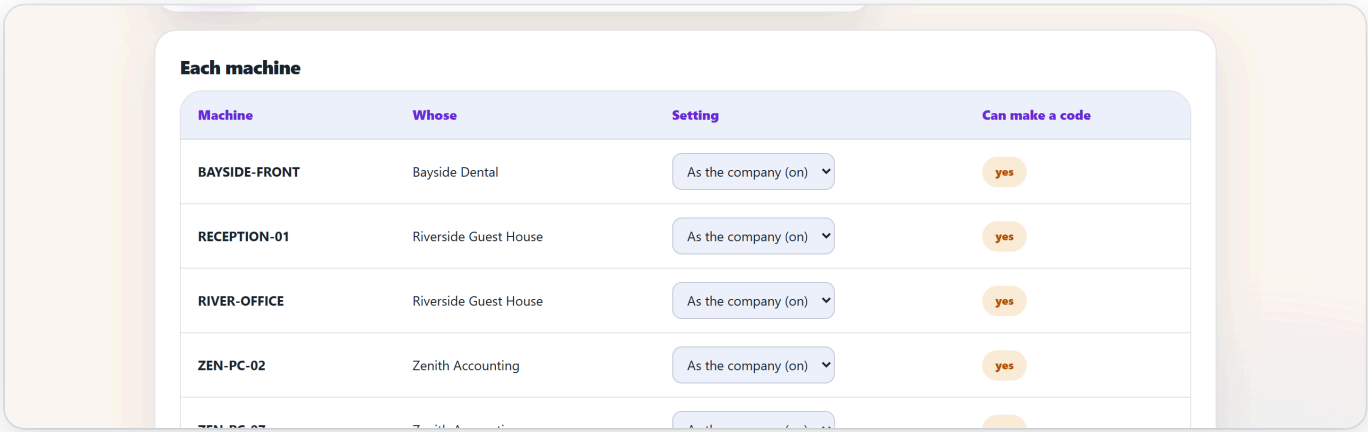

The customer makes a code in your app and reads it out.

The other person types the code in a web browser. No account and nothing to install.

- **A nine-digit code** that works **once**, for **ten minutes**.
- **The customer is always asked** to allow the person, by name, even on a computer that is normally unattended.
- **You are told straight away**, in the console. You can **watch** the session or **end** it.
- The other person can use a browser, or a small program for Windows. If they use our program at their own IT company, they connect with that.
- **Screen and control only.** No scripts, no clipboard, no sound.
- **Files only if the customer ticks it** when they allow the person.
- **Off unless you switch it on**: for your whole company, and then on or off for any single computer.
- Never unattended. It only works while someone is at the computer.

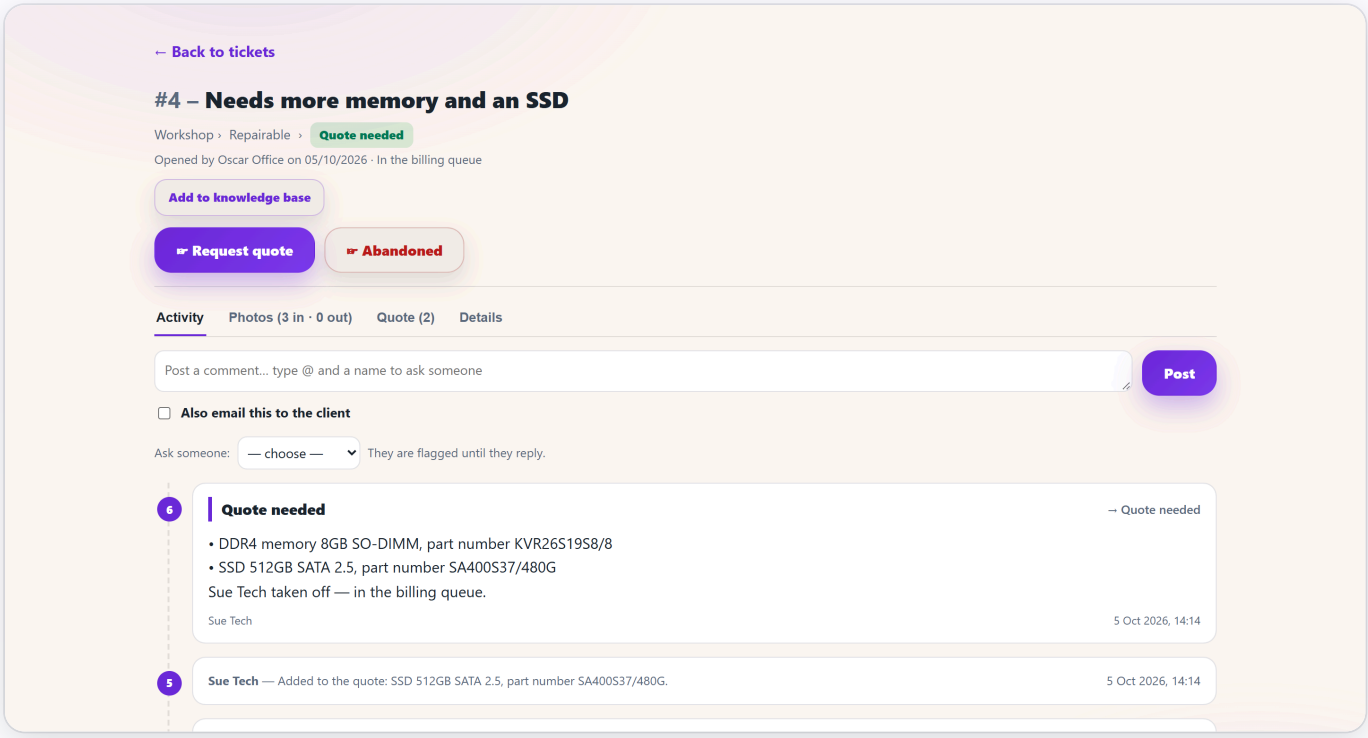

Outside help in the web portal: the company switch, and each computer's own setting.

TICKETS AND WORKFLOWS

Every job follows its own route

Each type of job has its own steps, and only the next steps are offered as buttons, so nobody has to remember the process. Each ticket reads like a story, newest first.

A workshop job at "Quote needed": the next steps at the top, a comment box, and the numbered story below.

Workshop

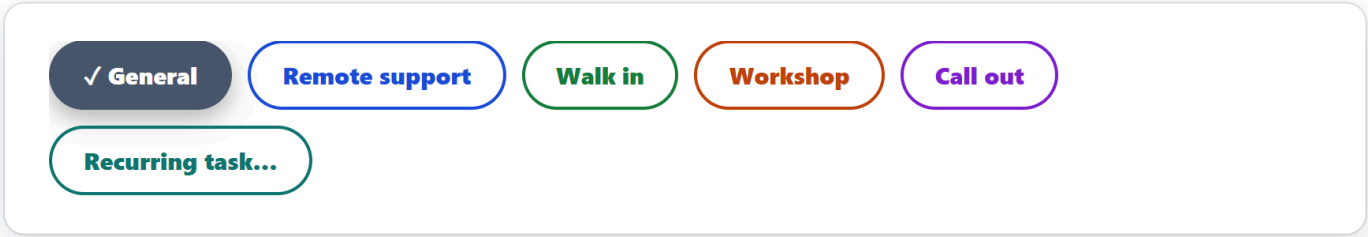

Booked in with photos, then findings, repairable or not, quote, solved and invoiced, then collected or delivered.

Call out and walk in

Appointment and address, rescheduled if needed, work done and time, paid on site, or sent to the workshop on the same ticket.

Remote, general, recurring

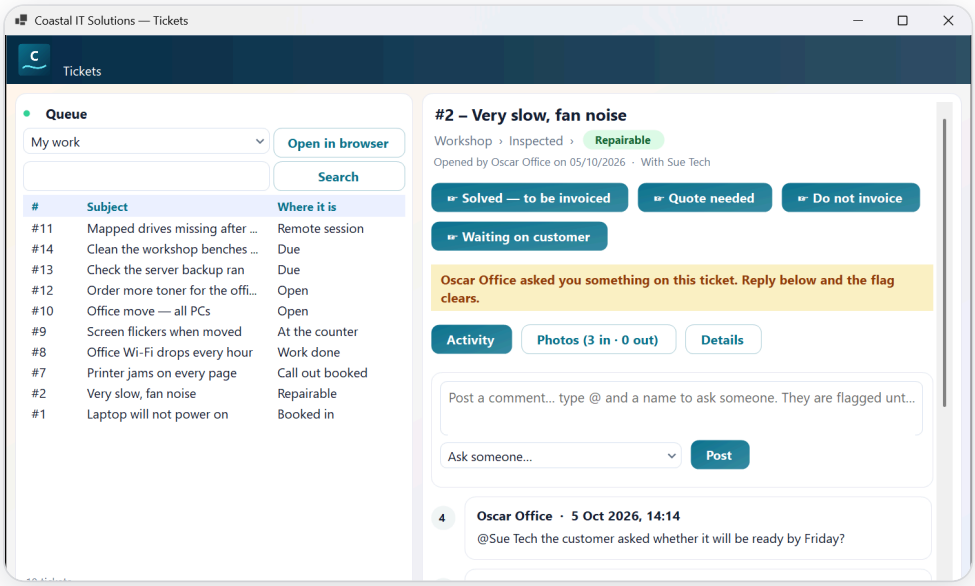

Invoice it, mark it as covered by an SLA, or link it to a bigger job. Recurring tasks open themselves when due.

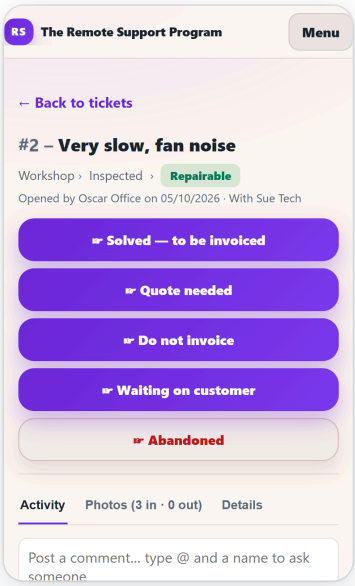

A new ticket starts with the type of job. Each type has its own colour, so the right one is easy to pick.

TICKETS AND WORKFLOWS

Built around how a workshop really works

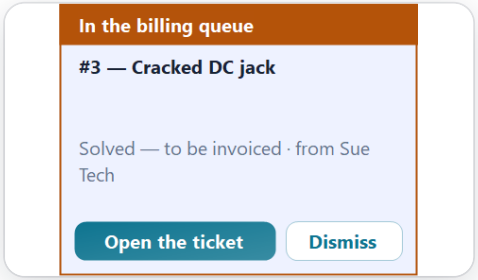

The same tickets inside the technician console.

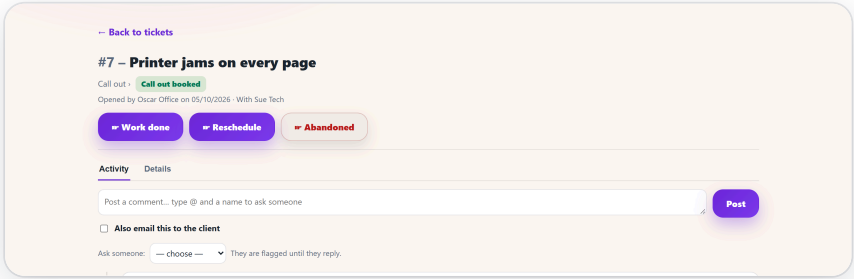

And on a phone.

- **Several people on one job**, from the start or added at any point.
- **Ask someone with @name.** They stay flagged until they reply.
- **Photos in and photos out**, at least three of each, made smaller automatically.
- **Quotes** from a shared parts list, emailed to your suppliers (next pages).
- **Delivery** as well as collection.
- **Several machines** on one booking, or two machines on one job.
- **Reschedule a call out**: a new date and time, and why.
- **Damage report needed** NEW for a machine not worth repairing, emailed to the client.
- **Go back a step** NEW at every stage, and **edit** NEW the subject, appointment or type of job.
- **Files and photos on any comment** NEW, and **sort by date** NEW.
- **The billing queue**: the office invoices, and the technician never closes a job.
- **The office is told** the moment a job is ready to invoice, with a pop-up and a count.
- **Every remote session is its own ticket** with its time.
- **Link a ticket to a bigger job**: it stays open, and the bigger job cannot close until its parts are done.
- **Tickets open themselves** from email, a contact form, the website chat or a customer's request.
- **Who has what**: everyone's open work, and anything nobody has been given.

The office is told a job is ready to invoice.

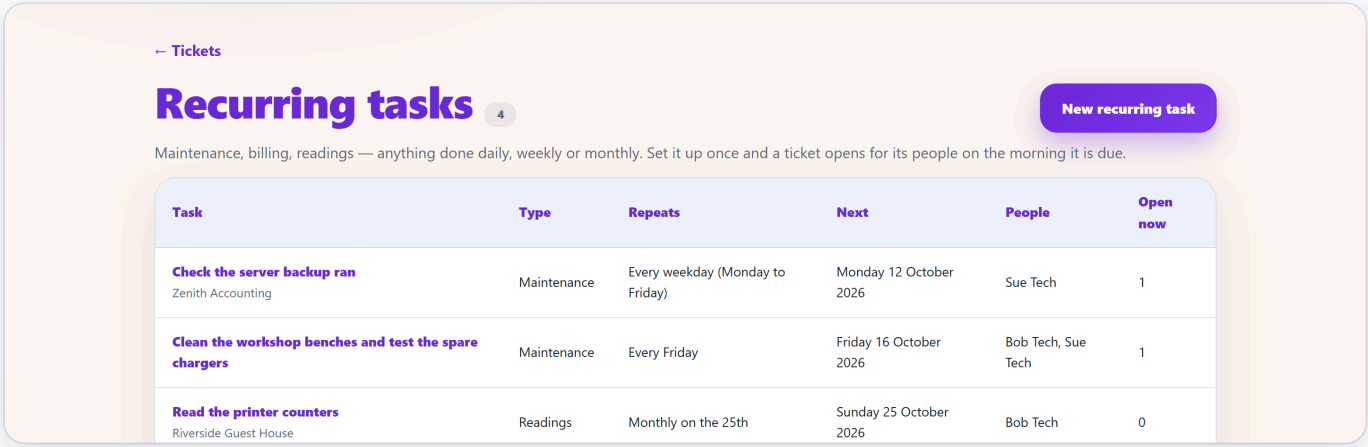

A call out, with Reschedule beside Work done.

RECURRING TASKS AND CLIENT UPDATES

Set it up once. Keep the client in the loop.

Recurring tasks

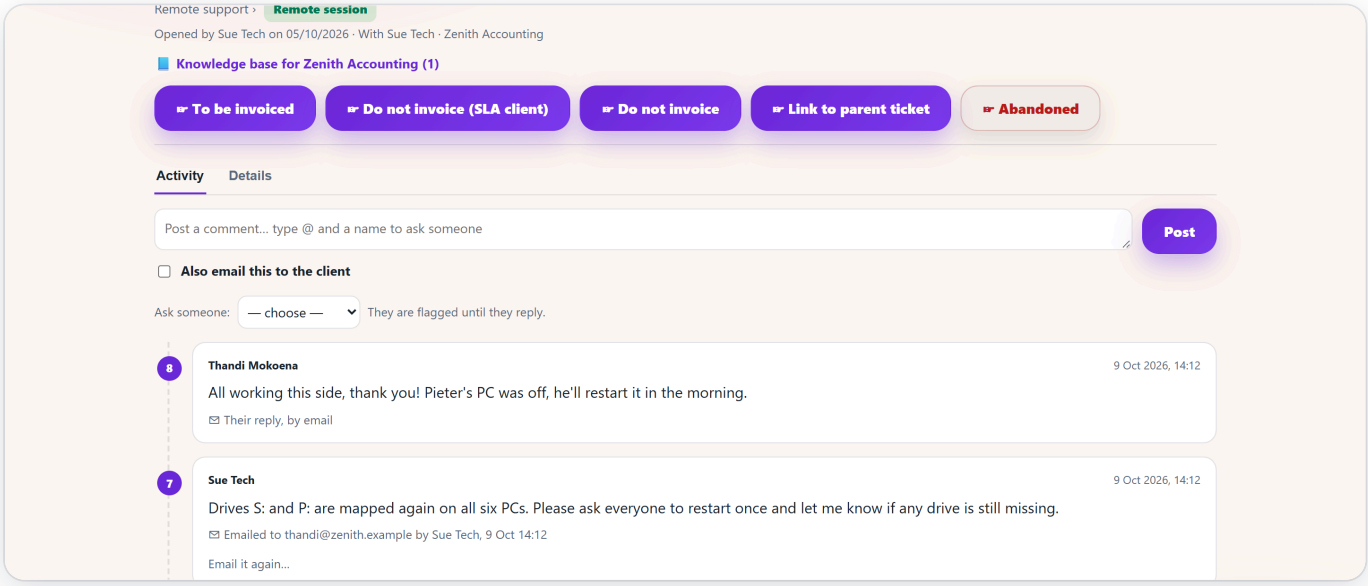

For anything done on a schedule: checking a client's backups, reading printer counters, sending monthly invoices. Set it up once and forget about it.

- **Daily** (or weekdays only), **weekly** on chosen days, or **monthly** on a date or the last day.
- On the morning it is due, **a ticket opens by itself**, already given to the right people.
- Done closes it, or send it to be invoiced.
- Change it or cancel it at any time. Past tickets stay.

Email the client from a ticket

Tick **Also email this to the client** under a comment. They get the original fault and your comment, from your support address. When they reply, it lands on the same ticket and everyone on the job is flagged.

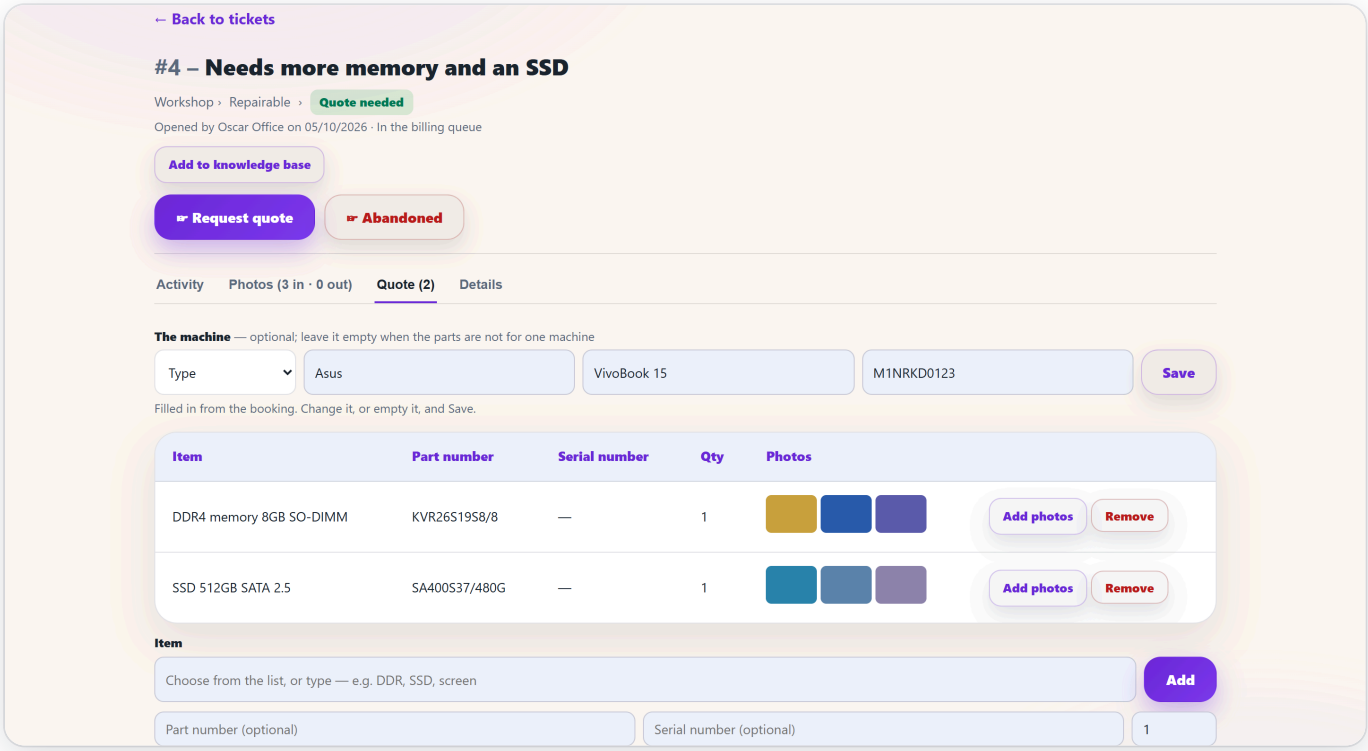

A comment emailed to the client (below), and her reply by email (above).

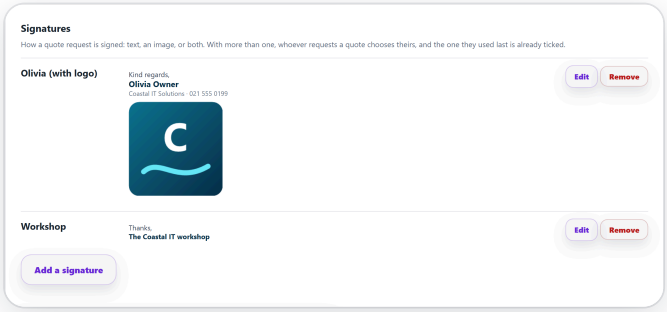

QUOTES AND SUPPLIERS

Quotes from your suppliers, quickly

Add the parts a job needs, then press Request quote. Your suppliers get a tidy email with your reference, and the answer comes back to the right ticket.

The quote on a workshop job: each item with its part number and its own photos.

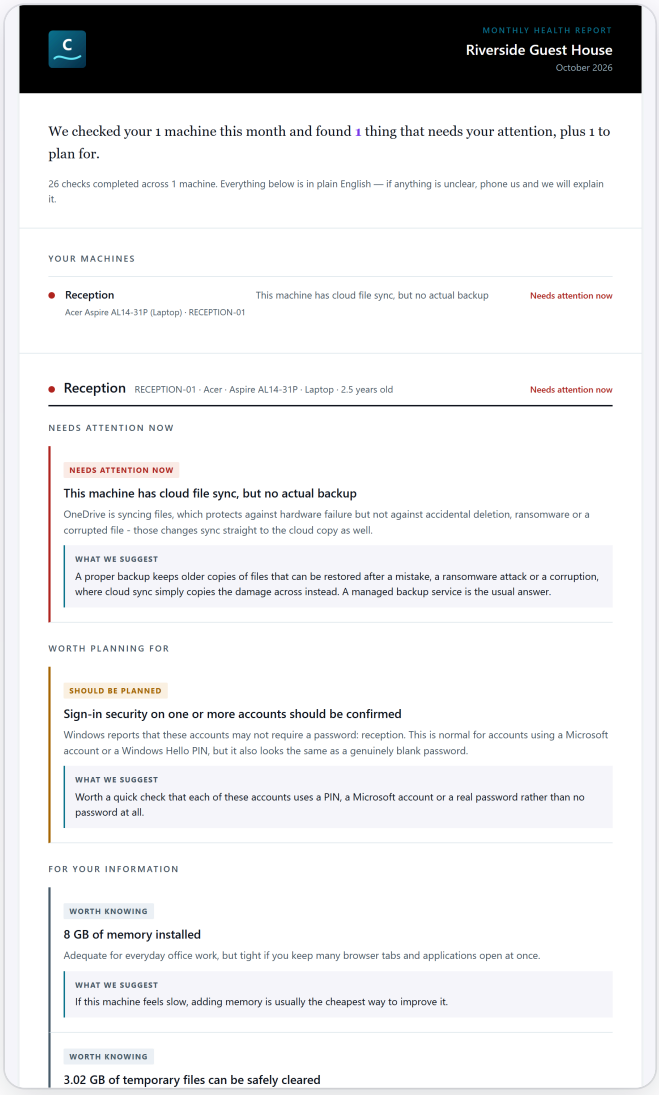

Signatures on the Suppliers page: words, your logo, or both.

- **Several photos for each item**, so the supplier sees exactly what is needed.
- **One supplier or several.** Several get the same email, without seeing each other.
- **Every request asks** the delivery fee, whether each item is **in stock**, and **how soon** it can be delivered.
- **Signed by you**: choose a signature, with your logo if you like. The last one you used is ticked.
- Works with Outlook and other desktop mail, or with web mail such as Gmail.
- A shared list of parts that refuses near-duplicates, so "DDR memory" and "memory DDR" never both appear.

MONTHLY HEALTH CHECK

A report your customers will actually read

Once a month every chosen machine tidies itself up and checks its own health. Your customer gets a branded report in plain English and you see the results in the portal.

MONTHLY HEALTH REPORT
Riverside Guest House
October 2026

We checked your 1 machine this month and found 1 thing that needs your attention, plus 1 to plan for.

26 checks completed across 1 machine. Everything below is in plain English — if anything is unclear, phone us and we will explain it.

YOUR MACHINES

Reception — This machine has cloud file sync, but no actual backup — Needs attention now
Acer Aspire AL14-31P (Laptop) · RECEPTION-01

Reception RECEPTION-01 · Acer · Aspire AL14-31P · Laptop · 2.5 years old — Needs attention now

NEEDS ATTENTION NOW

NEEDS ATTENTION NOW
This machine has cloud file sync, but no actual backup
OneDrive is syncing files, which protects against hardware failure but not against accidental deletion, ransomware or a corrupted file - those changes sync straight to the cloud copy as well.
WHAT WE SUGGEST
A proper backup keeps older copies of files that can be restored after a mistake, a ransomware attack or a corruption, where cloud sync simply copies the damage across instead. A managed backup service is the usual answer.

WORTH PLANNING FOR

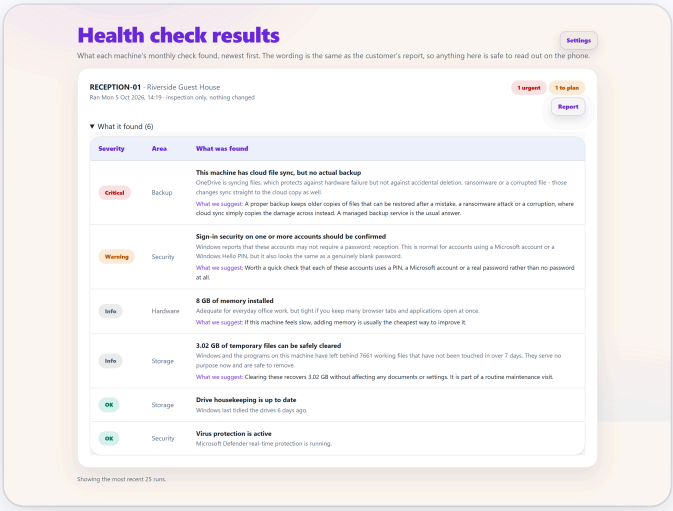

SHOULD BE PLANNED
Sign-in security on one or more accounts should be confirmed
Windows reports that these accounts may not require a password: reception. This is normal for accounts using a Microsoft account or a Windows Hello PIN, but it also looks the same as a genuinely blank password.
WHAT WE SUGGEST
Worth a quick check that each of these accounts uses a PIN, a Microsoft account or a real password rather than no password at all.

FOR YOUR INFORMATION

WORTH KNOWING
8 GB of memory installed
Adequate for everyday office work, but tight if you keep many browser tabs and applications open at once.
WHAT WE SUGGEST
If this machine feels slow, adding memory is usually the cheapest way to improve it.

WORTH KNOWING
3.02 GB of temporary files can be safely cleared

The customer's monthly report: real results from a real PC, under a demo company's branding.

Health check results
What each machine's monthly check found, newest first. The wording is the same as the customer's report, so anything here is safe to read out on the phone.

Report
▾ What it found (6)

Severity	Area	What was found
Critical	Backup	This machine has cloud file sync, but no actual backup — OneDrive is syncing files, which protects against hardware failure but not against accidental deletion, ransomware or a corrupted file - those changes sync straight to the cloud copy as well. What we suggest: A proper backup keeps older copies of files that can be restored after a mistake, a ransomware attack or a corruption, where cloud sync simply copies the damage across instead. A managed backup service is the usual answer.
Warning	Security	Sign-in security on one or more accounts should be confirmed — Windows reports that these accounts may not require a password: reception. This is normal for accounts using a Microsoft account or a Windows Hello PIN, but it also looks the same as a genuinely blank password. What we suggest: Worth a quick check that each of these accounts uses a PIN, a Microsoft account or a real password rather than no password at all.
Info	Hardware	8 GB of memory installed — Adequate for everyday office work, but tight if you keep many browser tabs and applications open at once. What we suggest: If this machine feels slow, adding memory is usually the cheapest way to improve it.
Info	Storage	3.02 GB of temporary files can be safely cleared — Windows and the programs on this machine have left behind 7661 working files that have not been touched in over 7 days. They serve no purpose now and are safe to remove. What we suggest: Clearing these recovers 3.02 GB without affecting any documents or settings. It is part of a routine maintenance visit.
OK	Storage	Drive housekeeping is up to date — Windows last tidied the drives 6 days ago.
OK	Security	Virus protection is active — Microsoft Defender real-time protection is running.

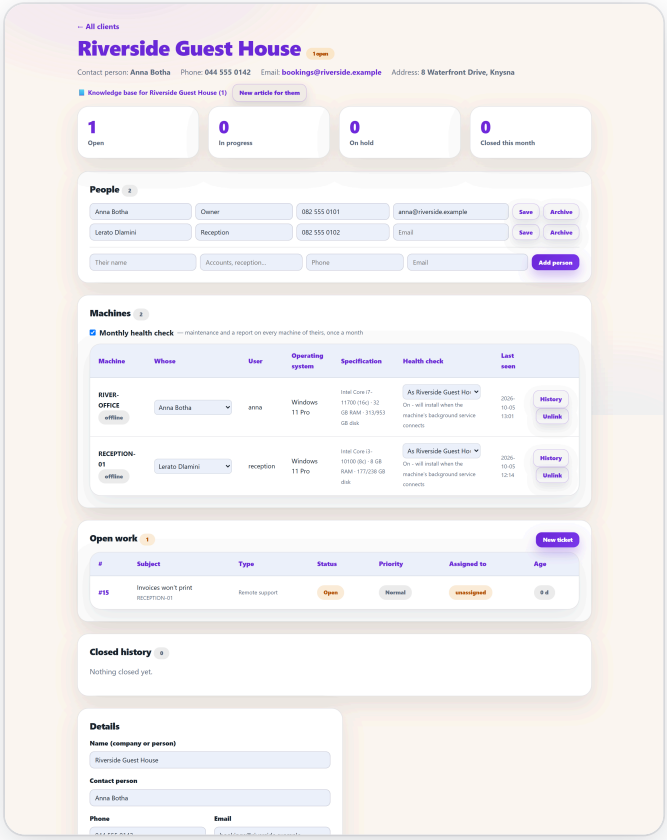

Showing the most recent 25 runs.

The same findings in your portal, safe to read out on the phone.

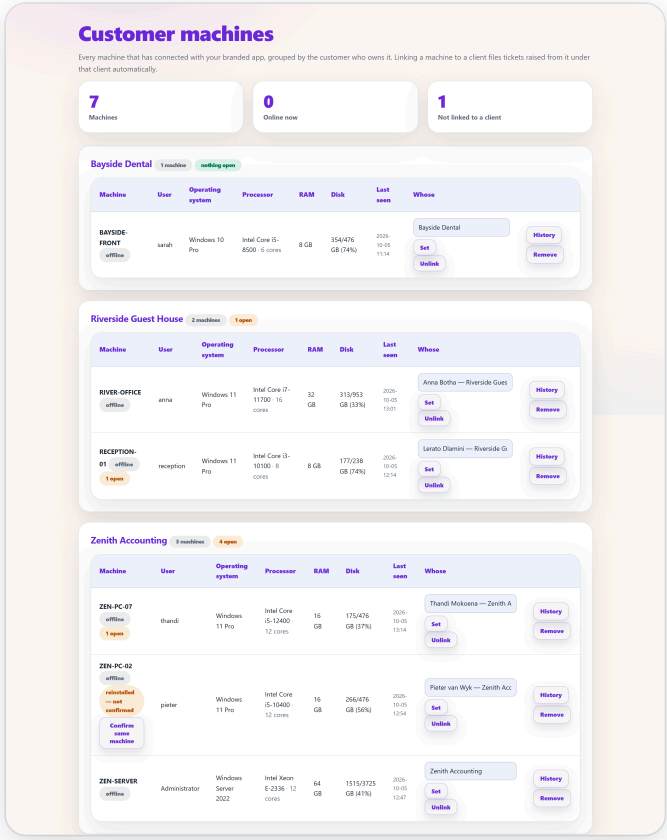

- **Backups**: tells a real backup apart from cloud sync, which copies a mistake or ransomware straight across.
- **Drive health** by the maker's own limits, and disk space.
- **Security**: antivirus, firewall, Windows updates, accounts without passwords.
- **Windows licence and Office version**, Windows 11 readiness, machine age, errors and unexpected shutdowns.
- **Maintenance**: clears temporary files and keeps drives in shape. Or choose inspection only.
- **Switch it on per client** (your SLA customers, say) and override it per machine.
- If antivirus briefly holds the install, it **tries again by itself**.

CLIENTS AND MACHINES

Know every customer and every computer

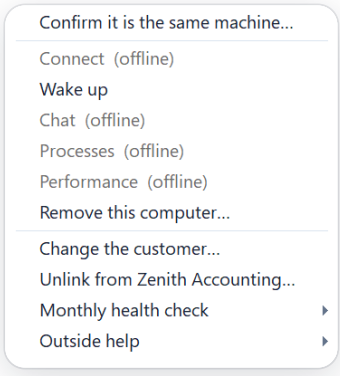

A client's page: people, machines, health check, open work and history.

Every machine, grouped by the customer who owns it.

- **Clients and their people**: one person, or a company with many contacts.
- **Machines link to a client**, so every ticket from that machine lands on the right page.
- **Hardware at a glance**. Nearly full disks are flagged.
- **Import your clients** from your old system, previewed first. Nothing you have is overwritten.
- **Remove a computer** with a reason. It goes on a removed list, and the app uninstalls itself if the computer is on.
- **Reinstalled computers** are flagged until a supervisor confirms it is the same machine.
- **Wake up** a computer that is off.

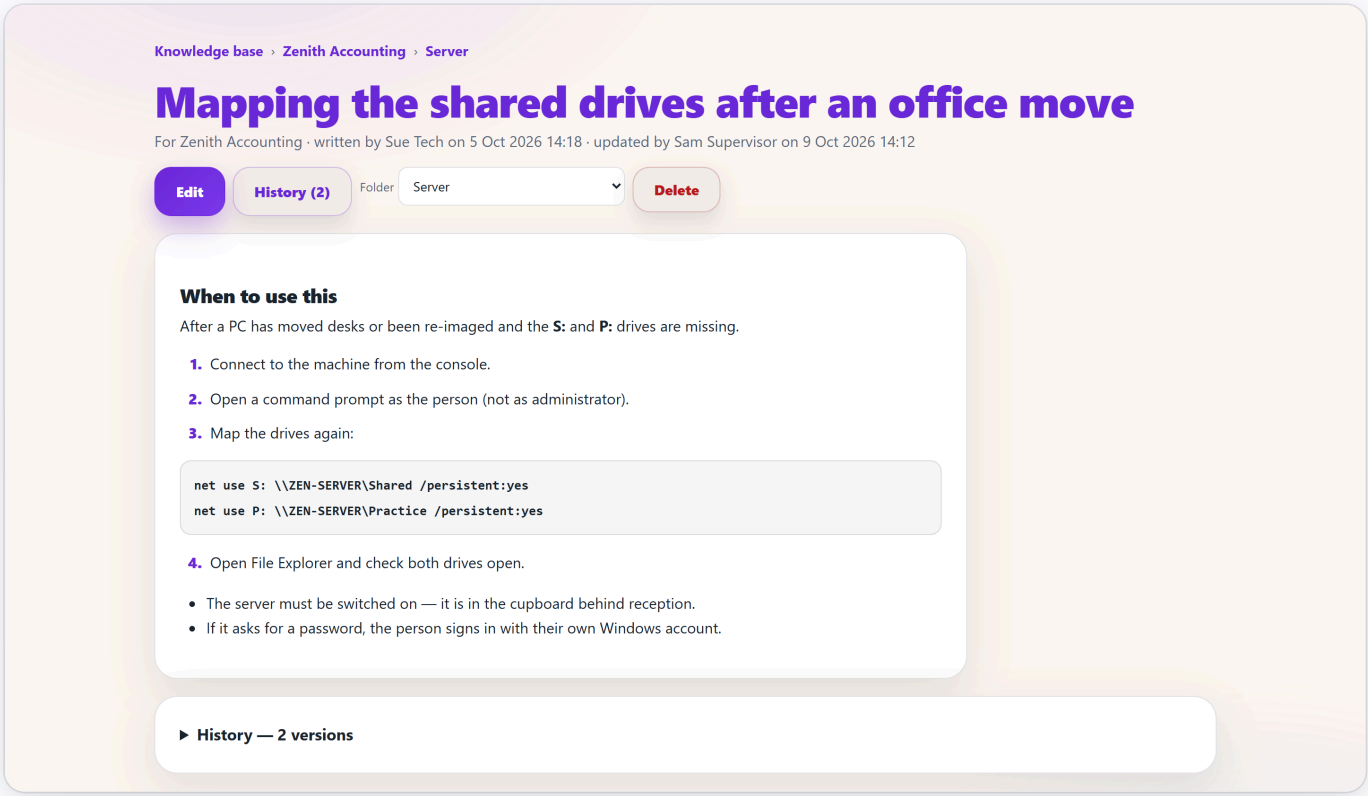

Right-click on a computer that is off.

KNOWLEDGE BASE

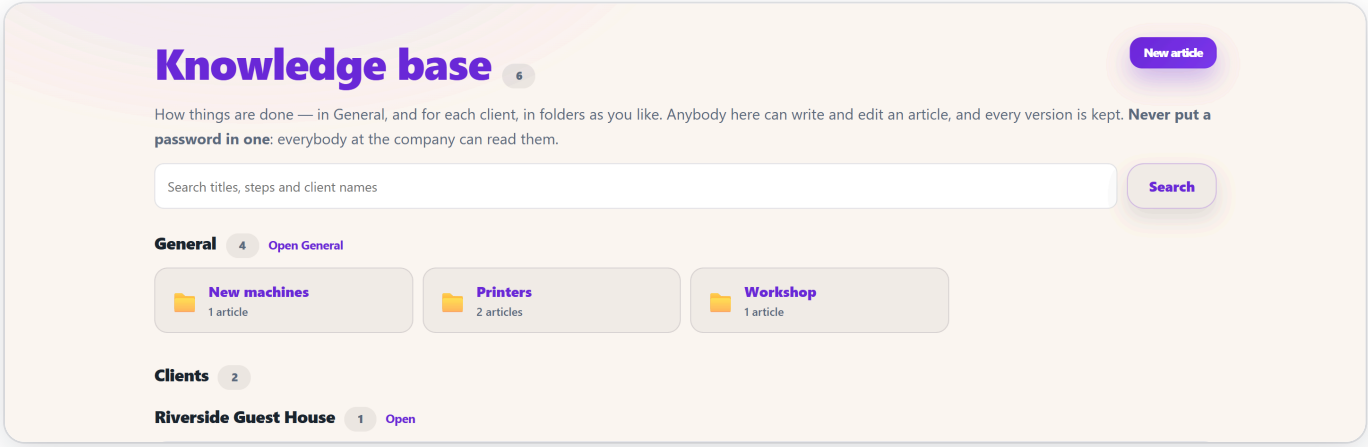

Write it down once, use it every time

How things are done, in general and for each client. It sits on every dashboard, and when a technician connects to a machine the console points them to that client's articles.

An article for one client: numbered steps, commands to copy, and a full history.

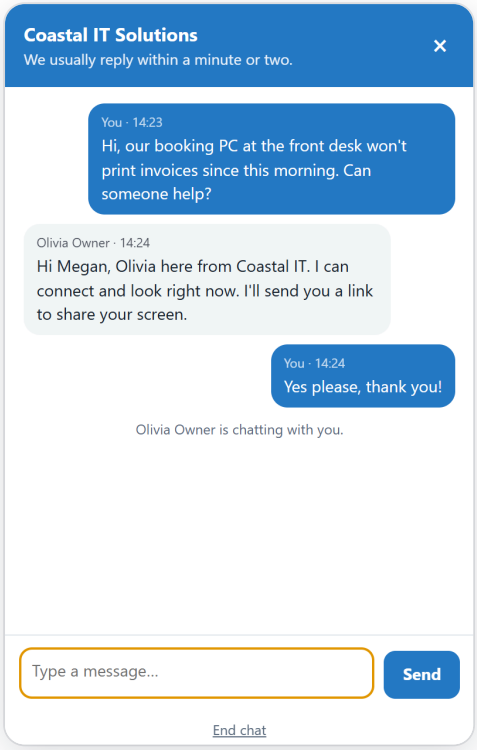

- **Folders**, in general and inside each client, up to six deep.
- **Link buttons**: a web address becomes a button that opens the site.
- **Add to knowledge base** straight from a finished ticket.
- Searchable by title, steps or client name.
- **Everybody can edit**, every version is kept and can be put back, and two people saving at once never overwrite each other.
- **Pictures** pasted straight in. A gentle warning if someone types what looks like a password.
- Only a supervisor or the owner can delete.

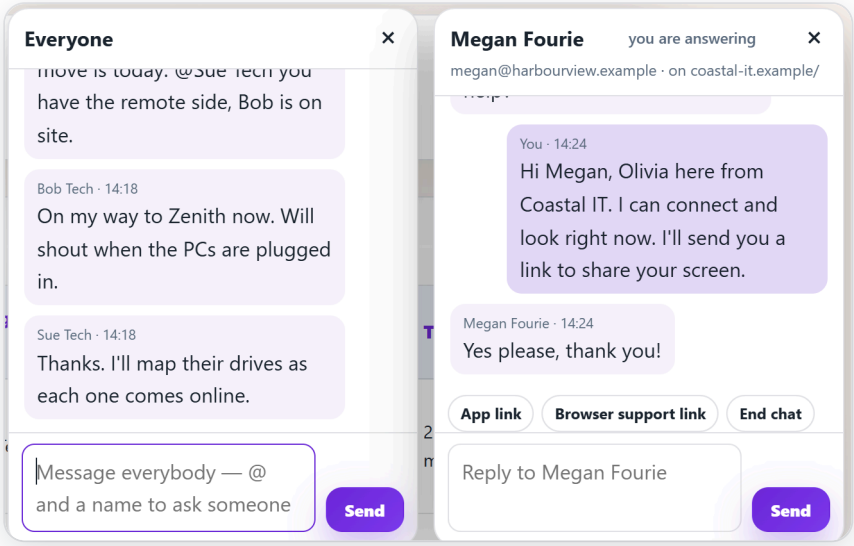

The knowledge base in folders: general first, then each client's.

CHAT AND CONTACT

Every way a customer might reach you

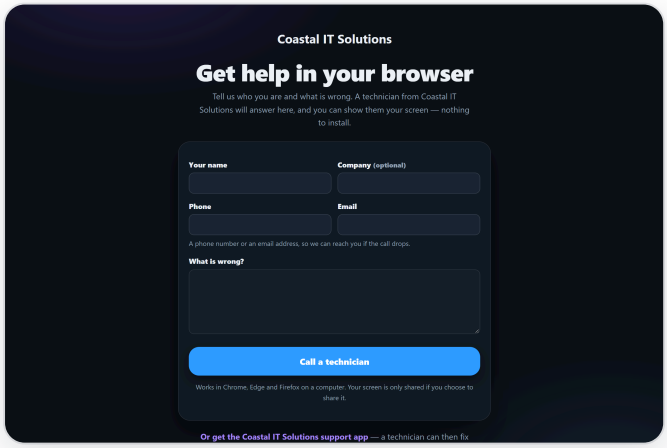

The chat bubble on your own website, seen by a visitor.

In the portal: office chat (left) and a website visitor being answered (right).

- **Website chat**: paste one line onto your website. A visitor's question pops up for everyone signed in, and the first to reply takes it. **Hand it over** NEW to a colleague who is signed in. Outside your hours it takes a message, and the message becomes a ticket.
- **Office chat**: one-to-one or everyone, in the console and the portal. A message to you pops up without stealing your keyboard.
- **A ding and a ring**: a ding for a new message, a soft ring while a visitor waits for an answer. One click mutes it.

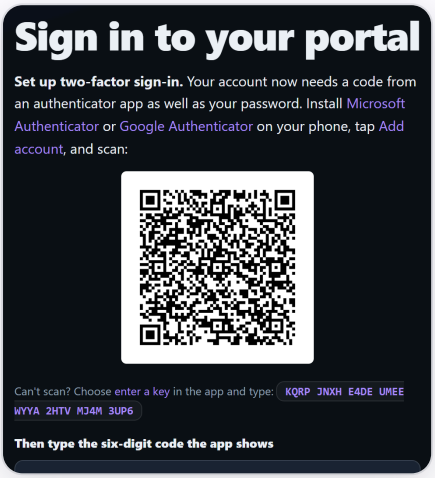

Support in a web browser: nothing to install.

- **Support in the browser**: a link for new customers. They describe the problem, a technician answers, and they can share their screen and talk, with nothing installed. View only.
- **Tickets by email**: mail to your support address opens a ticket, with an automatic reply giving the ticket number. Their reply goes onto the same ticket.
- **A contact form** for your website, which opens tickets the same way.
- **Chat with the customer** during or outside a session.

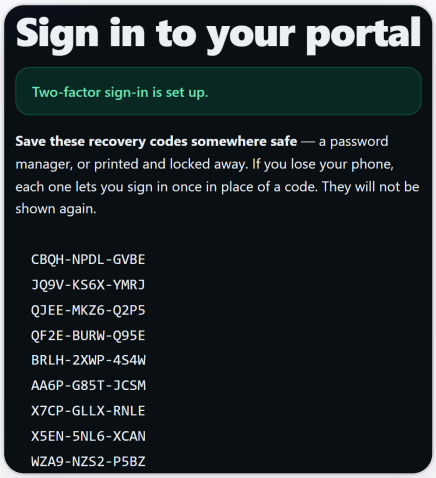

SECURITY

Access to your customers' machines, properly guarded

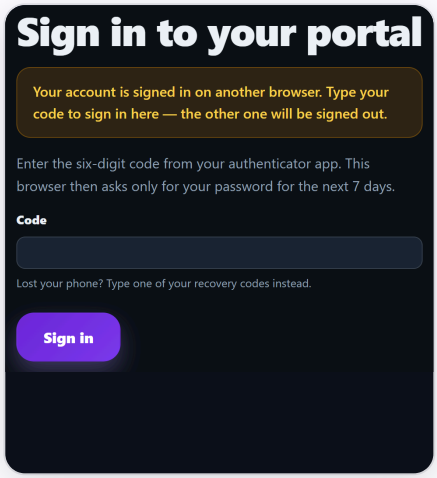

This software reaches deep into your customers' computers, so signing in and connecting are guarded seriously.

Setting up two-factor sign-in with an authenticator app.

Recovery codes, in case a phone is lost.

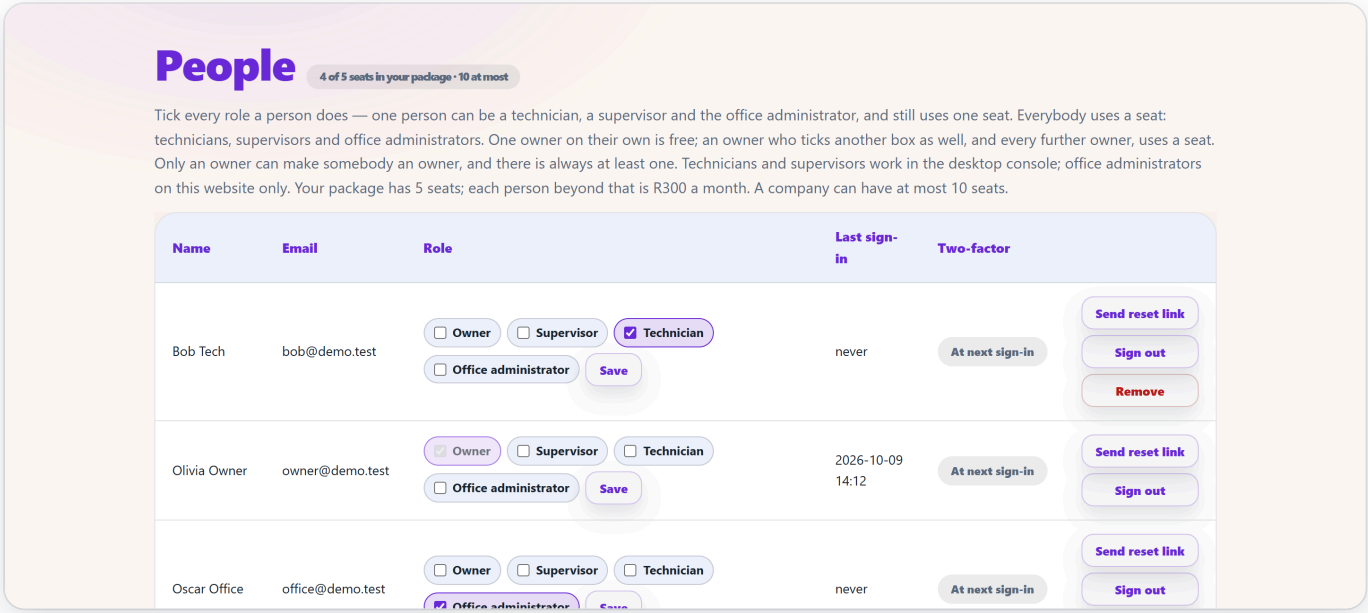

Signing in elsewhere signs the other place out.

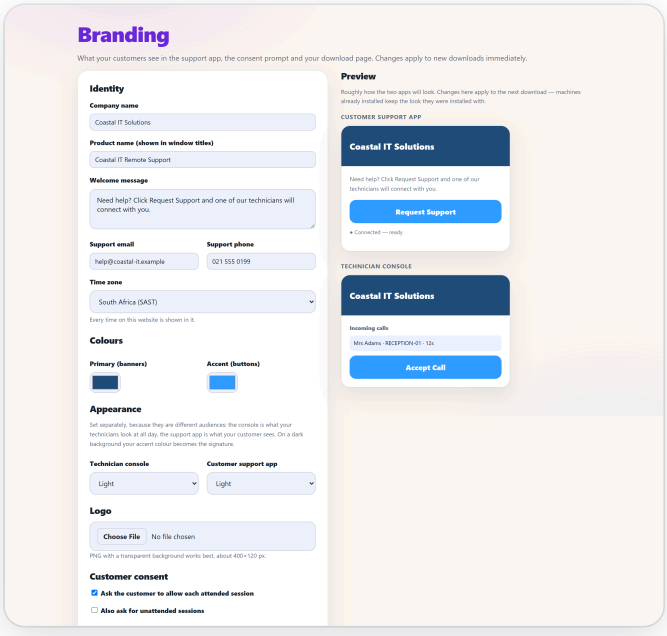

- **End-to-end encryption**: a session is sealed between your console and the customer's computer. Our server passes it along but cannot see it. The console shows a green lock, and warns you if a computer is not the one it knew.
- **Two-factor sign-in for everyone**, with recovery codes. A trusted browser asks for the code once a week.
- **One sign-in per person at a time.**
- **Lockout** after repeated wrong passwords. Idle sign-ins expire.
- **Remove someone, or change their password or role, and they are signed out at once.**
- **A reinstalled computer waits for the office**: until a supervisor confirms it, nobody gets in unattended.
- **Unattended passwords** set by the customer. Each technician types it right once per machine, and it is forgotten if the customer changes it.
- **Invitations**: new people choose their own password. Nobody sends passwords around.
- **Roles as tick boxes**. The office administrator has no remote access at all.
- **Customer consent** for attended sessions, and **clipboard contents are never logged**.
- **Nightly encrypted backups**, hosted in South Africa and **copied off the server**.
- **Signed apps** NEW: every program carries our company's signature, so Windows shows who made it.

YOUR TEAM AND YOUR BRAND

Set it up once, your way

People and roles. One person can hold several roles and still use one seat.

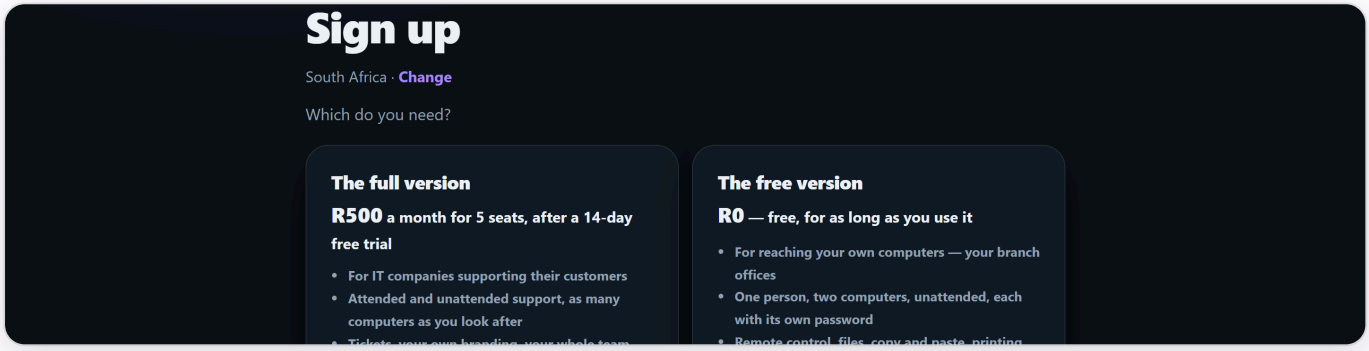

Branding, with a live preview of both apps.

- **Your package is five seats**, in any mix of roles, **plus one owner free** who oversees NEW: sees everything and comments, but does not work tickets or computers. More seats are on request, at R300 a month each if we agree. **Pilot companies have their five free while they are pilots.**
- **Several owners**. Only an owner can add or remove another, and there is always at least one.
- **Your company name, logo, colours and welcome message** in the customer's app, the console, the download page, the website chat and the health report.
- **Branding updates itself** on computers that already have the app, the next time it is idle.
- **Light or dark**, for each app and each person.
- **Your own download links**, for customers and for technicians.
- **The web portal works on a phone**, and its menu is now a row of clear tabs.

THE BASIC VERSION FOR REMOTE WORKERS

R50 a month, for reaching your own computers

Not everyone is an IT company. Some people just need to reach their own computers — the one at the office while they work from home, or a branch or a shop — with nobody there, or with somebody there to click Allow. The Basic Version for Remote Workers does that, and nothing more, for R50 a month after a 14-day free trial; for one computer, the Free Version does it for nothing.

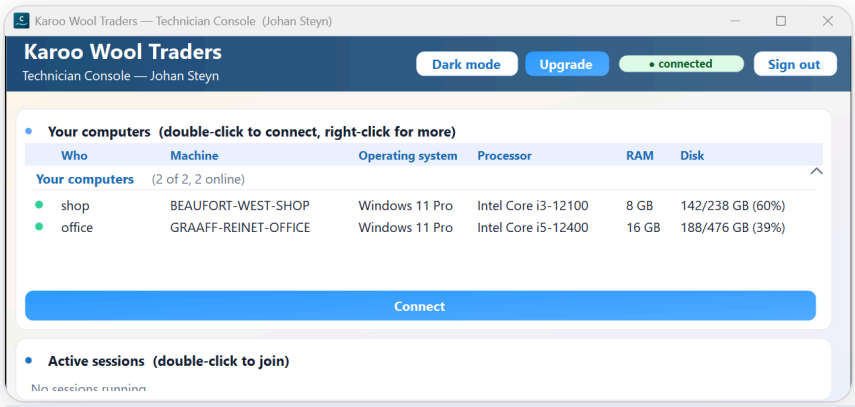

Signing up: the same page as the full version. After choosing the country, they choose Free, Basic or Full.

What it has

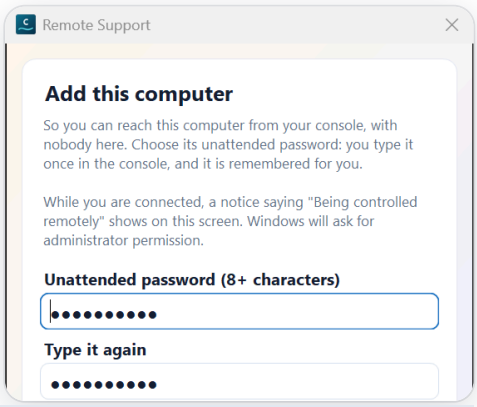

- **One person**, who is both the owner and the technician.
- **Three computers** they or their own company own, or whose owner lets them reach them — **more at R10 a month each**, up to 20.
- **Unattended** with the computer's password, chosen when the app is installed — typed once in the console, then remembered — **or attended**: without a password, the person there is asked to Allow.
- **Remote control, files, copy and paste, and printing** both ways.
- Two-factor sign-in, and end-to-end encryption, the same as the full version.

What it leaves out

- No support for customers. It is for your own computers only.
- No support requests from the computer, chat or outside help.
- No tickets, clients, knowledge base or team.
- No logo or colours to set up. It uses our own, with light and dark.
- No nag screens. Cancel any time, or move down to the Free Version: one computer, unattended, nothing to pay.

The Basic console: just their own computers, and an Upgrade button.

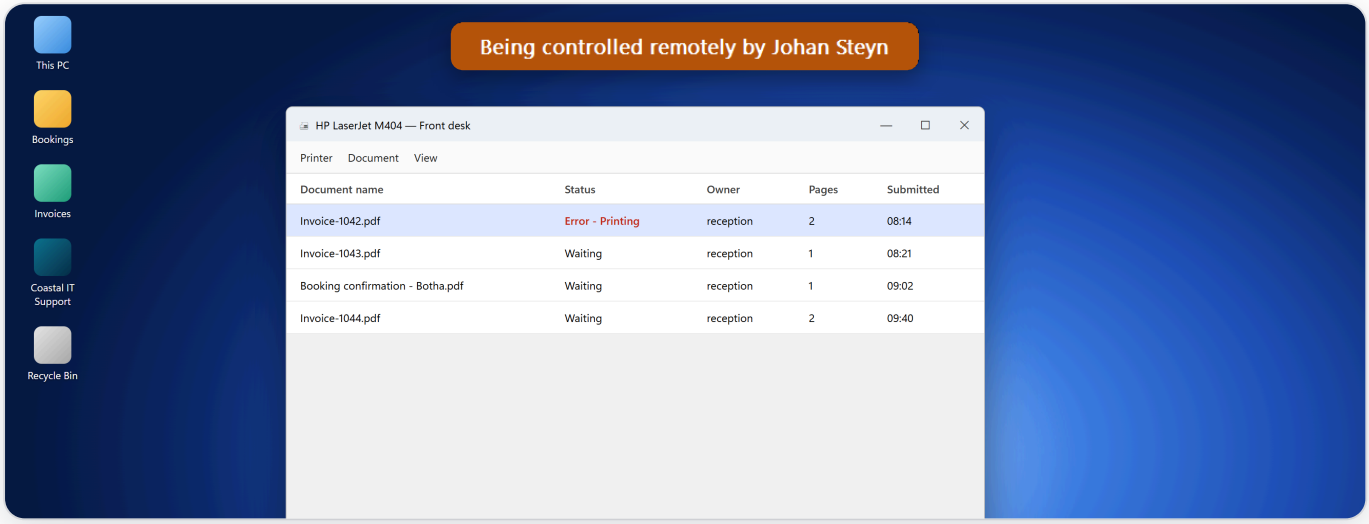

Installing on a computer: the password is chosen here — or left blank, to be asked each time.

THE BASIC VERSION FOR REMOTE WORKERS

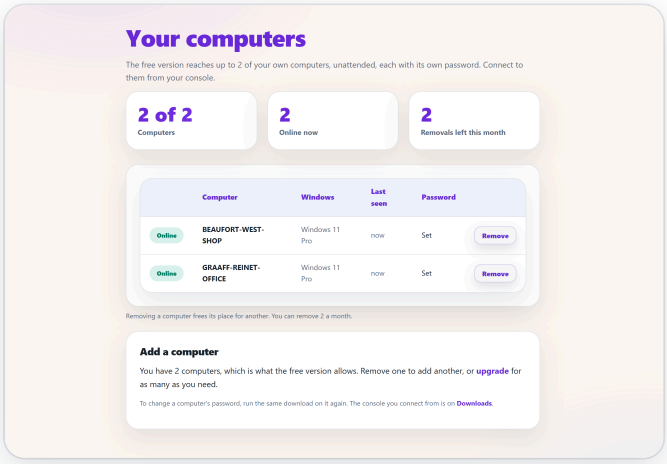

Simple, safe, and easy to grow out of

Everyone at the computer knows

There is no app sitting in the corner of a Basic computer's screen. Instead, while someone is connected, a bar across the top of every screen says who it is. It cannot be closed, the mouse goes straight through it, and the person connecting does not see it, so it never gets in their way.

What the person at a Basic computer sees while it is being used remotely.

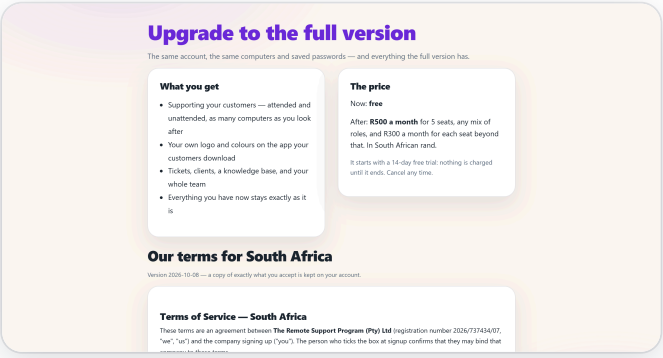

Their computers in the web portal.

- **As many as they pay for**: three, or more set on Billing (R10 each, up to 20). One more is refused with the reason, before anything is installed.
- **Swap a computer** by removing one in the console or the portal. That can be done twice a month, so its places cannot be passed around a whole customer base.
- Reinstalling the app on one of its computers does not count as another.
- **Change a password**, or leave it blank to be asked each time, by running the same download on that computer again.

Upgrade in place

- When they outgrow it, **Upgrade** turns the same account into the full version.
- The same computers and saved passwords, with nothing to reinstall.
- The full price takes over from their next payment (or when their trial ends). The price and the terms are shown before they agree.

Upgrading: what you get, and the price.

RS **The Remote Support Program**

Thank you for piloting with us

You are among the first IT companies to use it. What you tell us during the pilot decides what we improve next, so please tell us everything: what works, what gets in the way, and what you wish it did.

BUILT FROM THE GROUND UP

The remote control, the protocol and the portal are all our own work.

SOUTH AFRICAN

Hosted in South Africa, built for South African IT companies first.

The screenshots in this guide show demonstration companies: "Highveld Tech Solutions" in Part 1, "Coastal IT Solutions" in Parts 2 and 3 and, for the Basic version, "Karoo Wool Traders". Their clients, people, machines and part photos are made up. The health report shows real results from a real computer, renamed.
