INVESTMENT PROPOSAL · SEPTEMBER 2026

We built the tool our own IT company needed. Now we sell it to every other one.

Every IT support company in the country pays a foreign software firm every month, per technician, just to connect to a customer's computer. Then it pays again for something to track the jobs. **We built one program that does both** — and we own every line of it.

THE INVESTMENT

R500 000

One round, to finish the product and take it to market.

WHAT YOU RECEIVE

10% of turnover

Of every rand the product earns, paid out monthly as a dividend.

IF IT IS EVER SOLD

10% of the sale

You share in the exit as well as the income.

THE PROBLEM, IN PLAIN ENGLISH

Small IT companies are paying twice, in dollars, for tools that were never built for them.

They pay per person

The big remote-control programs charge for each technician. A three-man shop pays three times. Prices are in dollars, so every time the rand slips, the bill goes up.

They pay again for the paperwork

Connecting to a customer's PC is half the job. The other half — who phoned, what was wrong, what was done, what to invoice — needs a second system, bought separately.

Nothing joins up

The remote tool knows nothing about the customer. The job system knows nothing about the machine. The technician retypes everything, twice, on every call.

WHAT WE BUILT

One program. It fixes the computer and runs the business around it.

A technician clicks a name and is on the customer's screen. Everything that happens is already attached to that customer's record — no retyping, no second program, no second bill.

It does everything the others do

Take control of the mouse and keyboard. Work on password and permission screens the others often can't reach. Send files and whole folders both ways. Copy and paste between the two machines. Hear what the customer's computer is playing. Chat to the person sitting there.

And then it does the part they don't

Job cards for walk-ins, workshop repairs, call-outs and remote work. Customer records. A list of every machine, with its age, memory and disk space. And a health check that runs itself every month and emails the customer a report with your logo on it.

> **The part that sells it:** we charge **R500** a month for a whole company of up to five technicians — not per person. The same three-man shop currently pays several times that, in dollars, and still has no job cards.

WHY THIS IS NOT A SLIDE DECK WITH A DREAM ATTACHED

It is built, and each piece was tested until it proved itself.

Software is easy to claim and hard to check. So every feature below was verified by a separate test that had to pass before we accepted it — not by someone looking at a screen and saying it seemed fine.

WORKING	**Controlling the customer's computer.** Mouse, keyboard, several monitors, and the permission prompts that stop most remote tools dead. Proven on real customer machines.
WORKING	**Unattended access.** The technician connects to a machine with nobody sitting at it — the after-hours work that keeps a business running.
WORKING	**Files and folders, both directions.** Tested by sending a folder, then having the customer's machine independently fingerprint every file that arrived and comparing. Nineteen checks out of nineteen. A folder of files landed in under a third of a second.
WORKING	**Hearing the customer's machine.** Built and confirmed over a live connection to a real customer PC. The program also tells the technician *why* a machine is silent — which speaker it is using, whether it is muted. Neither TeamViewer nor AnyDesk does that.
WORKING	**Surviving a dropped connection.** If the technician's internet blinks, the session waits ninety seconds and picks up where it left off instead of collapsing. Ten checks out of ten against a real machine.
WORKING	**The monthly health check.** Runs itself on the customer's machine, writes a report in your colours with your logo, and emails it. Already sent for real, with the report attached.
WORKING	**The job system and customer portal.** Job cards, customer records, machines grouped by customer, appointments for call-outs, workshop repairs with serial numbers. In daily use.
NEEDS THE MONEY	**The digital signature.** Without it, Windows shows a scary warning the first time a customer installs the program. It is a certificate we buy, not something we can code around — and it is the single thing most likely to lose a sale.

NEEDS THE MONEY **Proper hosting and encryption.** Today it runs on our own network for our own testing. Going public means paid servers, a security certificate and monitoring.

NEEDS THE MONEY **Mac, iPhone and Android.** Windows is done. The others are a known, ordinary piece of work — they just need paying for.

SIDE BY SIDE

Where we win, and where we are still behind.

An honest table is worth more than a flattering one. Here is the whole picture, including the two rows we lose.

	OURS	TEAMVIEWER	ANYDESK
Take control of a customer's PC	✓	✓	✓
Reach locked and permission screens	✓	✓	✓
Connect with nobody at the machine	✓	✓	✓
Send files and folders	✓	✓	✓
Hear the customer's sound	✓	✓	✓
Tells you why the sound is broken	✓	—	—
Job cards and ticketing built in	✓	extra product	—
Customer records and machine list	✓	extra product	—
Automatic monthly health report	✓	—	—
Sell it under your own name and logo	✓	top tier only	top tier only
Works on Mac, iPhone, Android	month 4	✓	✓
Picture quality on a very slow line	good, improving	✓	✓
Price for a five-technician company	R500/mo	per technician	per technician

The two rows we lose are both known work already scheduled, not surprises. Picture quality is good on a normal business line today; the upgrade matters on rural connections.

WHERE THE R500 000 GOES

Half of it is not software. It is the people who put the software in front of customers.

R250 000

Anywhere IT — the support team

Three technicians who onboard every new IT firm personally, answer their technical questions and handle sales, here and abroad, until the system runs itself. A product like this is won or lost in the first week a customer uses it. This is the money that makes that week go well.

R200 000

The product

The digital signature certificate, secure hosting in each country we open, and the remaining development — Mac, iPhone and Android, and the picture-quality upgrade — with enough left over for the costs a first year of trading always turns up.

R50 000

The developer

Clint, who has written the entire system so far. Ten percent of the raise — the smallest slice of the three.

THE FIRST FIVE MONTHS

What your money actually does, month by month.

MONTH 1	**Make it safe to sell.** Buy the digital signature so the install is clean. Put proper encryption and hosting in place. Roll it out across Anywhere IT's own 1 000 clients — our own business becomes the first full-scale proof.
MONTHS 2–4	**Two other IT firms run it for real.** A paid pilot with two South African companies, so the product is tested by people who did not build it. At the same time, the Mac and mobile versions are built.

MONTH 5	**Open to South Africa.** Public sign-up, the pilot firms as the first references.
AFTER THAT	**United States, Canada, United Kingdom.** Each on its own servers in its own country, so a customer's data never leaves it — which is exactly what those markets ask for first.

THE MARKET

We only need a small slice of a market we already live in.

Small and medium IT companies — the ones with three to twenty technicians. Our estimate, from thirty-six years in this industry, is **around 1 000 in South Africa** and **at least 10 000** across our four target countries.

IF WE SIGN…	MONTHLY	PER YEAR	YOUR 10%, PER YEAR
25 IT companies	R12 500	R150 000	R15 000
100 IT companies — 10% of South Africa alone	R50 000	R600 000	R60 000
250 IT companies	R125 000	R1 500 000	R150 000
500 IT companies	R250 000	R3 000 000	R300 000

How to read this honestly. Every figure above is priced at the South African rate of **R500** a month. Overseas customers pay **$49** — close to double — so the international rows would in practice be considerably higher. These are illustrations of what given numbers of customers produce, not forecasts of how many we will sign.

WHAT YOU GET BACK

Income from month one of trading, and a share of the business if it is ever sold.

A monthly dividend

Ten percent of everything the product turns over, paid to you every month. Not ten percent of profit — of *turnover*, before any costs are taken out. It starts the first month a customer pays and does not stop.

Ten percent of a sale

Software businesses with monthly subscriptions are bought by larger companies at a multiple of their yearly income. If that day comes, a tenth of the price is yours.

> **Put plainly:** at 250 customers your share is **R150 000** a year against a **R500 000** investment — and it keeps paying every year after that, on top of your share of any sale.

WHO YOU ARE BACKING

Not a start-up. A working IT company that got tired of paying rent on someone else's software.

Clint — owner and developer

Thirty-six years in corporate and small-business IT support, and a user of remote support software for every one of them. He has written this entire system himself. He is not guessing at what technicians need; he has needed it daily since the 1990s.

Anywhere IT — the business behind it

Roughly **R1 million** a year in turnover, **three technicians**, and about **1 000 clients**. It is a real trading business, and it becomes the product's first and largest user on day one.

STRAIGHT ANSWERS

The three questions you should be asking.

What stops TeamViewer from simply adding job cards?

Nothing, except twenty years of not doing it. Their business is selling licences per technician to large corporates; the small IT shop's paperwork is not a market they chase. Even if they did, they would be adding it to a product that costs several times ours per person.

What if nobody buys it?

One company already has. Anywhere IT will run its own 1 000 clients on it in month one, replacing software it currently pays for. The product has a paying-scale user before a single stranger is approached — which is also why the pilot in months 2 to 4 is with two firms who did *not* build it. If they will not use it, we find that out in month three, not year three.

What if something happens to the developer?

Nothing in this is licensed or rented from anyone — the code is ours outright, so no supplier can switch it off or put the price up. And it is documented as it is built: every decision, every trap, and the reason behind each one is written down in the project itself, specifically so another developer can pick it up.

IN ONE PARAGRAPH

The hard part is already built and paid for.

Years of work are done and tested. What is left is a certificate to buy, servers to rent, and three people to put it in front of customers. **R500 000** covers all three — and returns a tenth of everything it earns, every month, for as long as it earns.

Clint Anywhere IT · clint@anywhereit.co.za

theremotesupportprogram.com

Figures for Anywhere IT's turnover, technicians and client base, and the estimates of market size, are the owner's own. Revenue tables are illustrations of given customer numbers at published prices, not forecasts. Product claims describe features built and tested as at September 2026; items marked “needs the money” are not yet complete and are listed as such deliberately.
